

# Dual, 500kSPS, 12-Bit, 2 + 2 Channel, Simultaneous Sampling ANALOG-TO-DIGITAL CONVERTER

## FEATURES

- 4 INPUT CHANNELS
- FULLY DIFFERENTIAL INPUTS
- 2 $\mu$ s TOTAL THROUGHPUT PER CHANNEL
- NO MISSING CODES
- 1MHz EFFECTIVE SAMPLING RATE
- LOW POWER: 40mW
- SSI SERIAL INTERFACE
- OPERATING TEMPERATURE RANGE:  
–40°C to +125°C

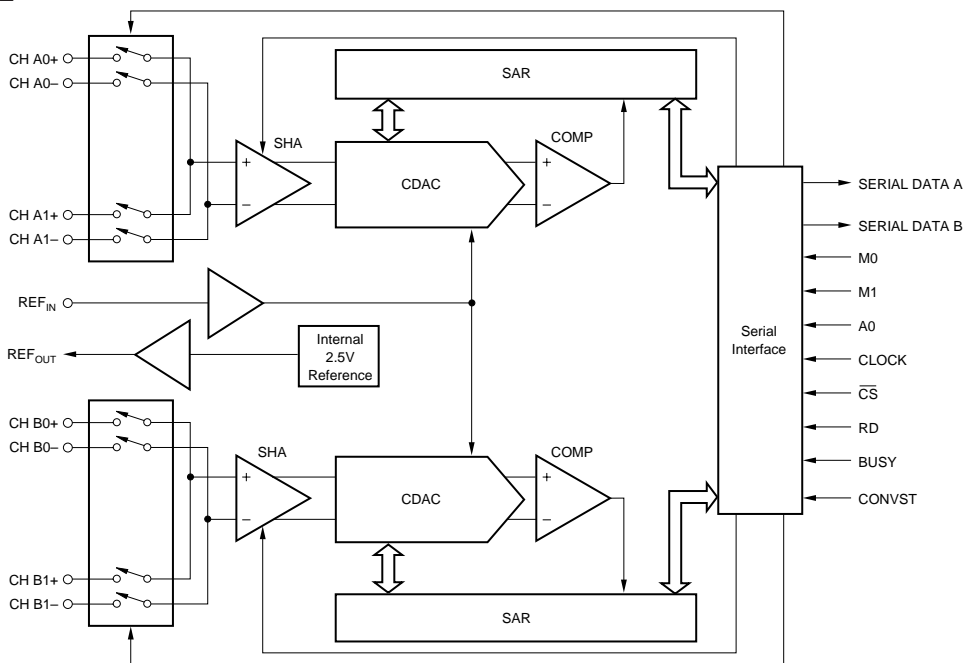

## APPLICATIONS

- MOTOR CONTROL
- MULTI-AXIS POSITIONING SYSTEMS
- 3-PHASE POWER CONTROL

## DESCRIPTION

The ADS7861 is a dual, 12-bit, 500kSPS, Analog-to-Digital (A/D) converter with four fully differential input channels grouped into two pairs for high speed, simultaneous signal acquisition. Inputs to the sample-and-hold amplifiers are fully differential and are maintained differential to the input of the A/D converter. This provides excellent common-mode rejection of 80dB at 50kHz which is important in high noise environments.

The ADS7861 offers a high-speed, dual serial interface and control inputs to minimize software overhead. The output data for each channel is available as a 12-bit word. The ADS7861 is offered in both an SSOP-24 and a QFN-32 package and is fully specified over the –40°C to +125°C operating range.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Analog Inputs to AGND, Any Channel Input	-0.3V to (+V <sub>D</sub> + 0.3V)
REF <sub>IN</sub>	-0.3V to (+V <sub>D</sub> + 0.3V)
Digital Inputs to DGND	-0.3V to (+V <sub>D</sub> + 0.3V)
Ground Voltage Differences: AGND, DGND	±0.3V
+V <sub>D</sub> to AGND	-0.3V to +6V
Power Dissipation	325mW
Maximum Junction Temperature	+150°C
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C

NOTE: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE/ORDERING INFORMATION

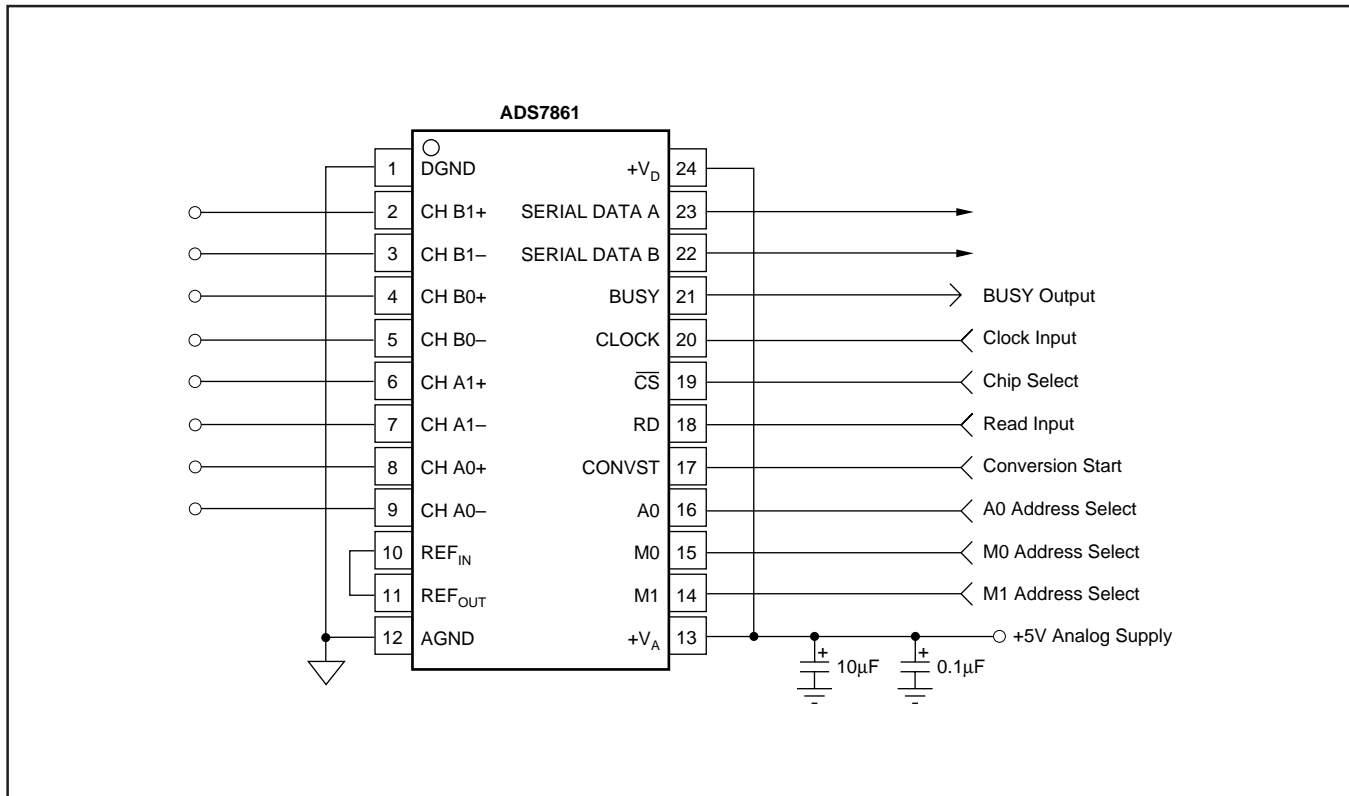

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at [www.ti.com](http://www.ti.com).

## PIN CONFIGURATIONS

## PIN DESCRIPTIONS

SSOP PIN	QFN PIN	NAME	DESCRIPTION
1	28	DGND	Digital Ground. Connect directly to analog ground (pin 12).
2	1	CH B1+	Noninverting Input Channel B1
3	2	CH B1-	Inverting Input Channel B1
4	3	CH B0+	Noninverting Input Channel B0
5	4	CH B0-	Inverting Input Channel B0
6	5	CH A1+	Noninverting Input Channel A1
7	6	CH A1-	Inverting Input Channel A1
8	7	CH A0+	Noninverting Input Channel A0
9	8	CH A0-	Inverting Input Channel A0
10	9	REF <sub>IN</sub>	Reference Input
11	10	REF <sub>OUT</sub>	2.5V Reference Output
12	12	AGND	Analog Ground. Connect directly to digital ground (pin 1).
13	13	+V <sub>A</sub>	Analog Power Supply, +5VDC. Connect directly to digital power supply (pin 24). Decouple to analog ground with a 0.1µF ceramic capacitor and a 10µF tantalum capacitor.
14	16	M1	Selects between the Serial Outputs. When M1 is LOW, both Serial Output A and Serial Output B are selected for data transfer. When M1 is HIGH, Serial output A is configured for both Channel A data and Channel B data; Serial Output B goes into tri-state (i.e., high impedance).
15	17	M0	Selects between two-channel and four-channel operation. When M0 is LOW, two-channel operation is selected and operates in conjunction with A0. When A0 is HIGH, Channel A1 and Channel B1 are being converted. When A0 is LOW, Channel A0 and Channel B0 are being converted. When M0 is HIGH, four-channel operation is selected. In this mode, all four channels are converted in sequence starting with Channels A0 and B0, followed by Channels A1 and B1.
16	18	A0	A0 operates in conjunction with M0. With M0 LOW and A0 HIGH, Channel A1 and Channel B1 are converted. With M0 LOW and A0 LOW, Channel A0 and Channel B0 are converted.
17	19	CONVST	Convert Start. When CONVST switches from LOW to HIGH, the device switches from the sample to hold mode, independent of the status of the external clock.
18	20	RD	Synchronization Pulse for the Serial Output.
19	21	$\overline{\text{CS}}$	Chip Select. When LOW, the Serial Output A and Serial Output B outputs are active; when HIGH, the serial outputs are tri-stated.
20	22	CLOCK	An external CMOS-compatible clock can be applied to the CLOCK input to synchronize the conversion process to an external source. The CLOCK pin controls the sampling rate by the equation: $\text{CLOCK} = 16 \cdot f_{\text{SAMPLE}}$ .
21	23	BUSY	BUSY goes HIGH during a conversion and returns LOW after the third LSB has been transmitted on either the Serial A or Serial B output pin.
22	24	SERIAL DATA B	The Serial Output data word is comprised of channel information and 12 bits of data. In operation, data is valid on the falling edge of DCLOCK for 16 edges after the rising edge of RD.
23	25	SERIAL DATA A	The Serial Output data word is comprised of channel information and 12 bits of data. In operation, data is valid on the falling edge of DCLOCK for 16 edges after the rising edge of RD. When M1 is HIGH, both Channel A data and Channel B data are available.
24	27	+V <sub>D</sub>	Digital Power Supply, +5VDC. Connect directly to pin 13. Must be $\leq +V_A$ .

# TYPICAL CHARACTERISTICS

# INTRODUCTION

The ADS7861 is a high-speed, low power, dual, 12-bit A/D converter that operates from a single +5V supply. The input channels are fully differential with a typical common-mode rejection of 80dB. The part contains dual, 2 $\mu$ s successive approximation ADCs, two differential sample-and-hold amplifiers, an internal +2.5V reference with REF<sub>IN</sub> and REF<sub>OUT</sub> pins and a high-speed parallel interface. The ADS7861 requires an external clock. In order to achieve the maximum throughput rate of 500kSPS, the master clock must be set at 8MHz. A minimum of 16 clock cycles are required for each 12-bit conversion.

There are four analog inputs that are grouped into two channels (A and B). Channel selection is controlled by the M0, M1 and A0 pins. Each channel has two inputs (A0 and A1 and B0 and B1) that can be sampled and converted simultaneously, thus preserving the relative phase information of the signals on both analog inputs. The part accepts an analog input voltage in the range of  $-V_{REF}$  to  $+V_{REF}$ , centered around the internal +2.5V reference. The part will also accept bipolar input ranges when a level shift circuit is used at the front end (see Figure 7).

All conversions are initiated on the ADS7861 by bringing the CONVST pin HIGH for a minimum of 15ns. CONVST HIGH places both sample-and-hold amplifiers in the hold state simultaneously and the conversion process is started on both channels. The RD pin can be connected to CONVST to simplify operation. Depending on the status of the M0, M1 and A0 pins, the ADS7861 will (a) operate in either two-channel or four-channel mode and (b) output data on both the Serial A and Serial B output or both channels can be transmitted on the A output only.

NOTE: See the Timing and Control section of this data sheet for more information.

## SAMPLE-AND-HOLD SECTION

The sample-and-hold amplifiers on the ADS7861 allow the ADCs to accurately convert an input sine wave of full-scale amplitude to 12-bit accuracy. The input bandwidth of the sample-and-hold is greater than the Nyquist rate (Nyquist equals one-half of the sampling rate) of the ADC even when the ADC is operated at its maximum throughput rate of 500kSPS. The typical small-signal bandwidth of the sample-and-hold amplifiers is 40MHz.

Typical aperture delay time or the time it takes for the ADS7861 to switch from the sample to the hold mode following the CONVST pulse is 3.5ns. The average delta of repeated aperture delay values is typically 50ps (also known as aperture jitter). These specifications reflect the ability of the ADS7861 to capture AC input signals accurately at the exact same moment in time.

## REFERENCE

Under normal operation, the REF<sub>OUT</sub> pin should be directly connected to the REF<sub>IN</sub> pin to provide an internal +2.5V reference to the ADS7861. The ADS7861 can operate, however, with an external reference in the range of 1.2V to 2.6V for a corresponding full-scale range of 2.4V to 5.2V.

The internal reference of the ADS7861 is double-buffered. If the internal reference is used to drive an external load, a buffer is provided between the reference and the load applied to pin 2 (the internal reference can typically source 2mA of current load—capacitance should not exceed 100pF). If an external reference is used, the second buffer provides isolation between the external reference and the CDAC. This buffer is also used to recharge all of the capacitors of both CDACs during conversion.

## ANALOG INPUT

The analog input is bipolar and fully differential. There are two general methods of driving the analog input of the ADS7861: single-ended or differential (see Figures 1 and 2). When the input is single-ended, the  $-IN$  input is held at the common-mode voltage. The  $+IN$  input swings around the same common voltage and the peak-to-peak amplitude is the (common-mode  $+V_{REF}$ ) and the (common-mode  $-V_{REF}$ ). The value of  $V_{REF}$  determines the range over which the common-mode voltage may vary (see Figure 3).

When the input is differential, the amplitude of the input is the difference between the  $+IN$  and  $-IN$  input, or  $(+IN) - (-IN)$ . The peak-to-peak amplitude of each input is  $\pm 1/2 V_{REF}$  around this common voltage. However, since the inputs are 180° out of phase, the peak-to-peak amplitude of the differential voltage is  $+V_{REF}$  to  $-V_{REF}$ . The value of  $V_{REF}$  also determines the range of the voltage that may be common to both inputs (see Figure 4).

FIGURE 1. Methods of Driving the ADS7861 Single-Ended or Differential.

FIGURE 2. Using the ADS7861 in the Single-Ended and Differential Input Modes.

FIGURE 3. Single-Ended Input: Common-Mode Voltage Range vs V<sub>REF</sub>.

FIGURE 4. Differential Input: Common-Mode Voltage Range vs V<sub>REF</sub>.

In each case, care should be taken to ensure that the output impedance of the sources driving the +IN and -IN inputs are matched. Otherwise, this may result in offset error, gain error and linearity error which will change with both temperature and input voltage.

The input current on the analog inputs depend on a number of factors: sample rate, input voltage, and source impedance. Essentially, the current into the ADS7861 charges the internal capacitor array during the sampling period. After this

capacitance has been fully charged, there is no further input current. The source of the analog input voltage must be able to charge the input capacitance (15pF) to a 12-bit settling level within 2 clock cycles. When the converter goes into the hold mode, the input impedance is greater than 1GΩ.

Care must be taken regarding the absolute analog input voltage. The +IN input should always remain within the range of GND - 300mV to V<sub>DD</sub> + 0.3V.

## TRANSITION NOISE

Figure 5 shows a histogram plot for the ADS7861 following 8,000 conversions of a DC input. The DC input was set at output code 2046. All but one of the conversions had an output code result of 2046 (one of the conversions resulted in an output of 2047). The histogram reveals the excellent noise performance of the ADS7861.

## BIPOLAR INPUTS

The differential inputs of the ADS7861 were designed to accept bipolar inputs ( $-V_{REF}$  and  $+V_{REF}$ ) around the internal reference voltage (2.5V), which corresponds to a 0V to 5V input range with a 2.5V reference. By using a simple op amp circuit featuring a single amplifier and four external resistors, the ADS7861 can be configured to accept bipolar inputs. The conventional  $\pm 2.5V$ ,  $\pm 5V$ , and  $\pm 10V$  input ranges can be interfaced to the ADS7861 using the resistor values shown in Figure 7.

FIGURE 5. Histogram of 8,000 Conversions of a DC Input.

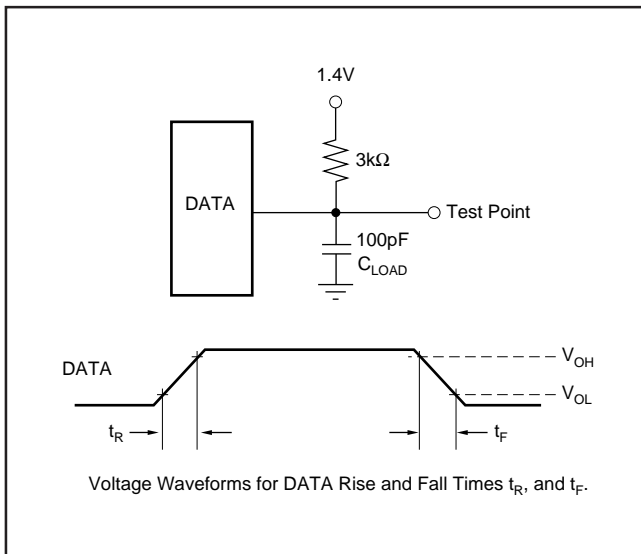

FIGURE 6. Test Circuits for Timing Specifications.

DESCRIPTION	ANALOG INPUT	DIGITAL OUTPUT BINARY TWO'S COMPLEMENT	
		BINARY CODE	HEX CODE

NOTES: (1)  $-V_{REF}$  to  $+V_{REF}$  around  $V_{REF}$ . With a 2.5V reference, this corresponds to a 0V to 5V input span. (2) 1.22mV with a 2.5V reference.

TABLE I. Ideal Input Voltages and Output Codes.

## TIMING AND CONTROL

The operation of the ADS7861 can be configured in four different modes by using the address pins M0, M1 and A0.

The M0 pin selects between two- and four-channel operation (in two-channel operation, the A0 pin selects between Channels 0 and 1; in four-channel operation the A0 pin is ignored and the channels are switched automatically after each conversion). The M1 pin selects between having serial data transmitted simultaneously on both the Serial A data output and the Serial B data output or having both channels output data through the Serial A port. The A0 pin selects either Channel 0 or Channel 1 (see Pin Descriptions and Serial Output Truth Table for more information).

The next four sections will explain the four different modes of operation.

### Mode I (M0 = 0, M1 = 0)

With the M0 and M1 pins both set to '0', the ADS7861 will operate in two-channel operation (the A0 pin must be used to switch between Channels A and B). A conversion is initiated by bringing CONVST HIGH for a minimum of 15ns. It is very important that CONVST be brought HIGH a minimum of 10ns prior to a rising edge of the external clock or 5ns after the rising edge. If CONVST is brought

FIGURE 7. Level Shift Circuit for Bipolar Input Ranges.

HIGH within this window, it is then uncertain as to when the ADS7861 will initiate conversion (see Figure 8 for a more detailed description). Sixteen clock cycles are required to perform a single conversion. Immediately following CONVST switching to HIGH, the ADS7861 will switch from the sample mode to the hold mode asynchronous to the external clock. The BUSY output pin will then go HIGH and remain HIGH for the duration of the conversion cycle. On the falling edge of the first cycle of the external clock, the ADS7861 will latch in the address for the next conversion cycle depending on the status of the A0 pin (HIGH =

Channel 1, LOW = Channel 0). The address must be selected 15ns prior to the falling edge of cycle one of the external clock and must remain 'held' for 15ns following the clock edge. For maximum throughput time, the CONVST and RD pins should be tied together. CS must be brought LOW to enable the two serial outputs. Data will be valid on the falling edge of all 16 clock cycles per conversion. The first bit of data will be a status flag for either Channel 0 or 1, the second bit will be a second status flag for either Channel A or B. The subsequent data will be MSB-first through the LSB, followed by two zeros (see Table II and Figures 9 and 10).

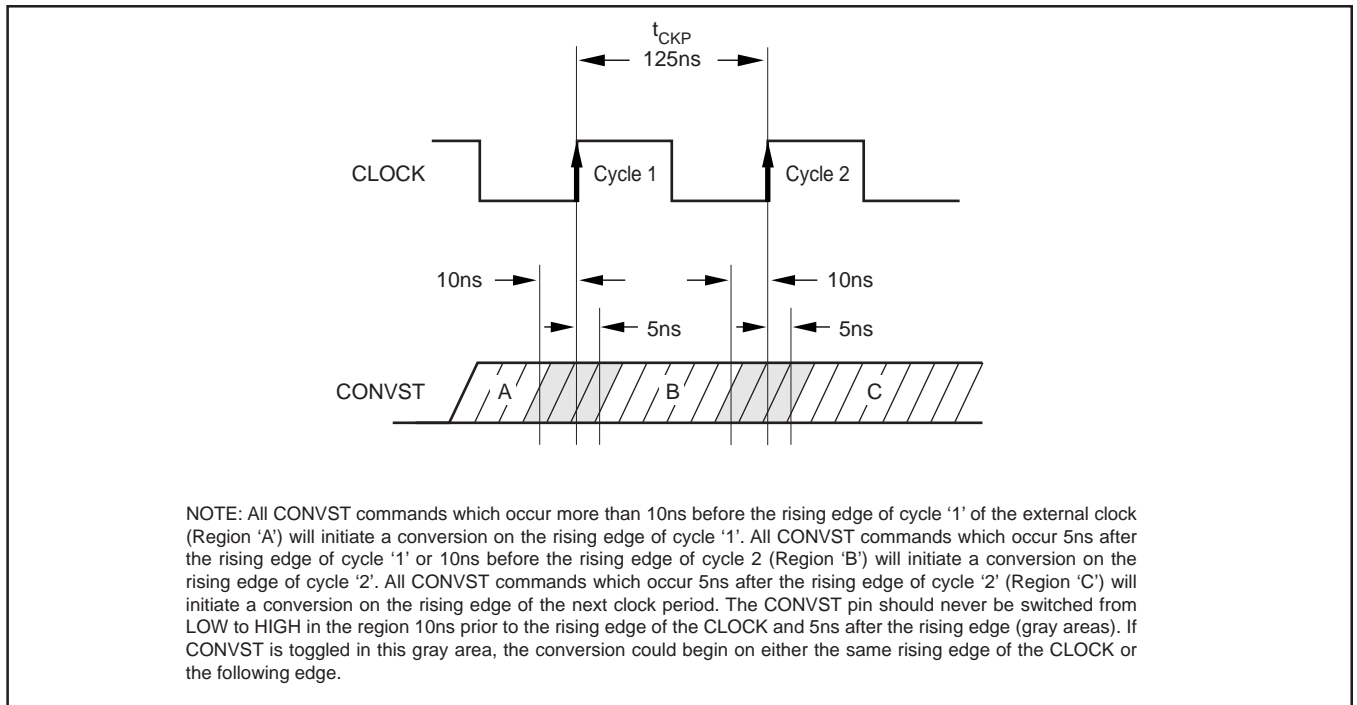

FIGURE 8. Conversion Mode.

TABLE II. Serial Data Output Format.

### Mode II (M0 = 0, M1 = 1)

With M1 set to '1', the ADS7861 will output data on the Serial Data A pin only. All other pins function in the same manner as Mode I except that the Serial Data B output will tri-state (i.e., high impedance) after a conversion following M1 going HIGH. Another difference in this mode involves the CONVST pin. Since it takes 32 clock cycles to output the results from both A/D converters (rather than 16 when M1 = 0), the ADS7861 will take 4 $\mu$ s to complete a conversion on both A/Ds (See Figure 11).

### Mode III (M0 = 1, M1 = 0)

With M0 set to '1', the ADS7861 will cycle through Channels 0 and 1 sequentially (the A0 pin is ignored). At the same time, setting M1 to '0' places both Serial Outputs, A and B, in the active mode (See Figure 12).

### Mode IV (M0 = 1, M1 = 1)

Similar to Mode II, Mode IV uses the Serial A output line to transmit data exclusively. Following the first conversion after M1 goes HIGH, the serial B output will go into tri-state. See Figure 13. As in Mode II, the second CONVST command is always ignored when M1 = 1.

## READING DATA

In all four timing diagrams, the CONVST pin and the RD pins are tied together. If so desired, the two lines can be separated. Data on the Serial Output pins (A and B) will become valid following the third rising SCLK edge following RD rising edge. Refer to Table II for data output format.

## LAYOUT

For optimum performance, care should be taken with the physical layout of the ADS7861 circuitry. This is particularly true if the CLOCK input is approaching the maximum throughput rate.

The basic SAR architecture is sensitive to glitches or sudden changes on the power supply, reference, ground connections and digital inputs that occur just prior to latching the output of the analog comparator. Thus, driving any single conversion for an n-bit SAR converter, there are n "windows" in which large external transient voltages can affect the conversion result. Such glitches might originate from switching power supplies, nearby digital logic or high power devices. The degree of error in the digital output depends on the reference voltage, layout, and the exact timing of the external event. Their error can change if the external event changes in time with respect to the CLOCK input.

With this in mind, power to the ADS7861 should be clean and well-bypassed. A 0.1 $\mu$ F ceramic bypass capacitor should be placed as close to the device as possible. In addition, a 1 $\mu$ F to 10 $\mu$ F capacitor is recommended. If needed, an even larger capacitor and a 5 $\Omega$  or 10 $\Omega$  series resistor may be used to low pass filter a noisy supply. On average, the ADS7861 draws very little current from an external reference as the reference voltage is internally buffered. However, glitches from the conversion process appear at the V<sub>REF</sub> input and the reference source must be able to handle this. Whether the reference is internal or external, the V<sub>REF</sub> pin should be bypassed with a 0.1 $\mu$ F capacitor. An additional larger capacitor may also be used, if desired. If the reference voltage is external and originates from an op amp, make sure that it can drive the bypass capacitor or capacitors without oscillation. No bypass capacitor is necessary when using the internal reference (tie pin 10 directly to pin 11).

The GND pin should be connected to a clean ground point. In many cases, this will be the 'analog' ground. Avoid connections which are too near the grounding point of a microcontroller or digital signal processor. If required, run a ground trace directly from the converter to the power supply entry point. The ideal layout will include an analog ground plane dedicated to the converter and associated analog circuitry.

		2	Absolute Maximum Ratings	Changed Operating Temperature Range upper limit from $+85^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ .	
		3	Electrical Characteristics		Changed top-of-page header condition to begin with: "Over recommended operating free-air temperature range at..."
					Changed " $T_{\text{MIN}}$ to $T_{\text{MAX}}$ " to " $T_{\text{A}} = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ " in several locations.
					Added $T_{\text{A}} = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ to conditions for these parameters: Bipolar Offset Error, Total Harmonic Distortion, Spurious-Free Dynamic Range, Quiescent Current, and Power Dissipation.
					Added new row for $T_{\text{A}} = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ condition for these parameters: Bipolar Offset Error, Total Harmonic Distortion, Spurious-Free Dynamic Range, Quiescent Current, and Power Dissipation.
					Moved " $V_{\text{IN}} = \pm 2.5V_{\text{PP}}$ at 100kHz" from conditions of Dynamic Characteristics to section header.

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

  - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15) per side.
  - D. Falls within JEDEC MO-137 variation AE.

RHB (S-PQFP-N32)

PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - QFN (Quad Flatpack No-Lead) Package configuration.
  - The Package thermal pad must be soldered to the board for thermal and mechanical performance. See product data sheet for details regarding the exposed thermal pad dimensions.
  - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

RHB (S-PQFP-N32)

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
