

TMS320VC5506 Fixed-Point Digital Signal Processor

Data Manual

Literature Number: SPRS375C
October 2006 – Revised January 2008

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

REVISION HISTORY

This revision history highlights the technical changes made to SPRS375B to generate SPRS375C.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
17	Table 2–3, Signal Descriptions: – Updated/changed GPIO.A[13:0] FUNCTION description from "... External Bus Selection Register is 11. ... enabling the Data EMIF mode." to "... External Bus Selection Register is 00, enabling the Data EMIF mode."
18	Table 2–3, Signal Descriptions (Continued): – Updated/changed A[15:14] RESET CONDITION description from "... GPIO0 = 0: Input, GPIO.A[15:14]" to "... GPIO0 = 0: Reserved" – Updated/changed D[15:0] FUNCTION description from "... The data bus keepers are <i>disabled</i> at reset, ..." to "... The data bus keepers are <i>enabled</i> at reset, ...".
37	Figure 3–5, External Bus Selection Register: – Updated/changed reset value for Parallel Port Mode (EBSR.[1:0])
61	Table 3–31, External Bus Selection Register: – Deleted "Hardware reset; x denotes a "don't care." footnote – Updated/changed the "The reset value is ..." footnote
62	Table 3–32, Interrupt Table: – Updated/changed the SOFTWARE (TRAP) EQUIVALENT "SINT10" to "Reserved"

1 TMS320VC5506 Features

- **High-Performance, Low-Power, Fixed-Point TMS320C55x™ Digital Signal Processor**
 - 9.26-ns Instruction Cycle Time
 - 108-MHz Clock Rate
 - One/Two Instruction(s) Executed per Cycle
 - Dual Multipliers [Up to 216 Million Multiply-Accumulates per Second (MMACS)]
 - Two Arithmetic/Logic Units (ALUs)
 - Three Internal Data/Operand Read Buses and Two Internal Data/Operand Write Buses
- **64K x 16-Bit On-Chip RAM, Composed of:**
 - 64K Bytes of Dual-Access RAM (DARAM) 8 Blocks of 4K × 16-Bit
 - 64K Bytes of Single-Access RAM (SARAM) 8 Blocks of 4K × 16-Bit
- **On-Chip Bootloader**
- **8M × 16-Bit Maximum Addressable External Memory Space (Synchronous DRAM)**
- **16-Bit External Memory Interface (EMIF) With GPIO Capabilities and Glueless Interface to:**
 - Asynchronous Static RAM (SRAM)
 - Asynchronous EPROM
 - Synchronous DRAM (SDRAM)
- **Programmable Low-Power Control of Six Device Functional Domains**
- **On-Chip Scan-Based Emulation Logic**
- **On-Chip Peripherals**
 - Two 20-Bit Timers
 - Watchdog Timer
 - Six-Channel Direct Memory Access (DMA) Controller
 - Three Multichannel Buffered Serial Ports (McBSPs)
 - Programmable Phase-Locked Loop Clock Generator
 - Seven (LQFP) or Eight (BGA) General-Purpose I/O (GPIO) Pins and a General-Purpose Output Pin (XF)
 - USB Full-Speed (12 Mbps) Slave Port Supporting Bulk, Interrupt and Isochronous Transfers
 - Inter-Integrated Circuit (I²C) Multi-Master and Slave Interface
 - Real-Time Clock (RTC) With Crystal Input, Separate Clock Domain, Separate Power Supply
- **IEEE Std 1149.1† (JTAG) Boundary Scan Logic**
- **Packages:**
 - 144-Terminal Low-Profile Quad Flatpack (LQFP) (PGE Suffix)
 - 179-Terminal MicroStar BGA™ (Ball Grid Array) (GHH and ZHH Suffixes)
- **1.2-V Core (108 MHz), 2.7-V – 3.6-V I/Os**

2 Introduction

This section describes the main features of the TMS320VC5506, lists the pin assignments, and describes the function of each pin. This data manual also provides a detailed description section, electrical specifications, parameter measurement information, and mechanical data about the available packaging.

NOTE: This data manual is designed to be used in conjunction with the *TMS320C55x™ DSP Functional Overview* (literature number SPRU312), the *TMS320C55x DSP CPU Reference Guide* (literature number SPRU371), and the *TMS320C55x DSP Peripherals Overview Reference Guide* (literature number SPRU317).

2.1 Description

The TMS320VC5506 fixed-point digital signal processor (DSP) is based on the TMS320C55x DSP generation CPU processor core. The C55x™ DSP architecture achieves high performance and low power through increased parallelism and total focus on reduction in power dissipation. The CPU supports an internal bus structure that is composed of one program bus, three data read buses, two data write buses, and additional buses dedicated to peripheral and DMA activity. These buses provide the ability to perform up to three data reads and two data writes in a single cycle. In parallel, the DMA controller can perform up to two data transfers per cycle independent of the CPU activity.

The C55x CPU provides two multiply-accumulate (MAC) units, each capable of 17-bit x 17-bit multiplication in a single cycle. A central 40-bit arithmetic/logic unit (ALU) is supported by an additional 16-bit ALU. Use of the ALUs is under instruction set control, providing the ability to optimize parallel activity and power consumption. These resources are managed in the Address Unit (AU) and Data Unit (DU) of the C55x CPU.

The C55x DSP generation supports a variable byte width instruction set for improved code density. The Instruction Unit (IU) performs 32-bit program fetches from internal or external memory and queues instructions for the Program Unit (PU). The Program Unit decodes the instructions, directs tasks to AU and DU resources, and manages the fully protected pipeline. Predictive branching capability avoids pipeline flushes on execution of conditional instructions.

The 128K bytes of on-chip memory on 5506 is sufficient for many hand-held appliances, portable GPS systems, wireless speaker phones, portable PDAs, and gaming devices. Many of these appliances typically require 64K bytes or more on-chip memory but less than 128K bytes of memory, and need to operate in standby mode for more than 60% to 70% of time. For the applications which require more than 128K bytes of on-chip memory but less than 256K bytes of on-chip memory, Texas Instruments (TI) offers the TMS320VC5509A device, which is based on the TMS320C55x DSP core.

The 5506 peripheral set includes an external memory interface (EMIF) that provides glueless access to asynchronous memories like EPROM and SRAM, as well as to high-speed, high-density memories such as synchronous DRAM. Additional peripherals include Universal Serial Bus (USB), real-time clock, watchdog timer, and I²C multi-master and slave interface. Three full-duplex multichannel buffered serial ports (McBSPs) provide glueless interface to a variety of industry-standard serial devices, and multichannel communication with up to 128 separately enabled channels. The DMA controller provides data movement for six independent channel contexts without CPU intervention, providing DMA throughput of up to two 16-bit words per cycle. Two general-purpose timers, up to eight dedicated general-purpose I/O (GPIO) pins, and digital phase-locked loop (DPLL) clock generation are also included.

The 5506 is supported by the industry's award-winning eXpressDSP™, Code Composer Studio™ Integrated Development Environment (IDE), DSP/BIOS™, Texas Instruments' algorithm standard, and the industry's largest third-party network. The Code Composer Studio IDE features code generation tools including a C Compiler and Visual Linker, simulator, RTDX™, XDS510™, XDS560™, emulation device drivers, and evaluation modules. The 5506 is also supported by the C55x DSP Library which features more than 50 foundational software kernels (FIR filters, IIR filters, FFTs, and various math functions) as well as chip and board support libraries.

2.2 Pin Assignments

Figure 2–1 illustrates the ball locations for the 179-pin ball grid array (BGA) package and is used in conjunction with Table 2–1 to locate signal names and ball grid numbers.

DV_{DD} is the power supply for the I/O pins while CV_{DD} is the power supply for the core. V_{SS} is the ground for both the I/O pins and the core. RCV_{DD} and RDV_{DD} are RTC module core and I/O supply, respectively. USBV_{DD} is the USB module I/O (DP, DN, and PU) supply. USBPLL_{V_{DD}} and USBPLL_{V_{SS}} are the dedicated supply and ground pins for the USB PLL, respectively.

2.2.1 Terminal Assignments for the GHH and ZHH Packages

Figure 2–1. 179-Terminal GHH and ZHH Ball Grid Array (Bottom View)

2.2.2 Pin Assignments for the PGE Package

The TMS320VC5506PGE 144-pin low-profile quad flatpack (LQFP) pin assignments are shown in Figure 2–2 and is used in conjunction with Table 2–2 to locate signal names and pin numbers.

DV_{DD} is the power supply for the I/O pins while CV_{DD} is the power supply for the core. V_{SS} is the ground for both the I/O pins and the core. RCV_{DD} and RDV_{DD} are RTC module core and I/O supply, respectively. $USBV_{DD}$ is the USB module I/O (DP, DN, and PU) supply. $USBPLLV_{DD}$ and $USBPLLV_{SS}$ are the dedicated supply and ground pins for the USB PLL, respectively.

Figure 2–2. 144-Pin PGE Low-Profile Quad Flatpack (Top View)

Table 2–2. Pin Assignments for the PGE Package

PIN NO.	SIGNAL NAME	PIN NO.	SIGNAL NAME	PIN NO.	SIGNAL NAME	PIN NO.	SIGNAL NAME
1	V _{SS}	37	V _{SS}	73	V _{SS}	109	RDV _{DD}

2.3 Signal Descriptions

Table 2–3 lists each signal, function, and operating mode(s) grouped by function. See Section 2.2 for pin locations based on package type.

Table 2–3. Signal Descriptions

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS					
A[13:0]		I/O/Z	A subset of the parallel address bus A13–A0 of the C55x™ DSP core bonded to external pins. These pins serve in one of two functions: EMIF address bus (EMIF.A[13:0]) or general-purpose I/O (GPIO.A[13:0]). The initial state of these pins depends on the GPIO0 pin. The address bus has a bus holder feature that eliminates passive component requirement and the power dissipation associated with them. The bus holders keep the address bus at the previous logic level when the bus goes into a high-impedance state.	BK	GPIO0 = 1: Output, EMIF.A[13:0]
	EMIF.A[13:0]	O/Z	EMIF address bus. EMIF.A[13:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 01. This setting enables the full EMIF mode and the EMIF drives the parallel port address bus. The internal A[14] address is exclusive-ORed with internal A[0] address and the result is routed to the A[0] pin.		GPIO0 = 0: Reserved
	GPIO.A[13:0]	I/O/Z	General-purpose I/O address bus. GPIO.A[13:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00, enabling the Data EMIF mode.		
A'[0] (BGA only)	EMIF.A'[0]	O/Z	EMIF address bus A'[0]. This pin is not multiplexed with EMIF.A[14] and is used as the least significant external address pin on the BGA package.		Output

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS (CONTINUED)					
A[15:14] (BGA only)		I/O/Z	A subset of the parallel address bus A15–A14 of the C55x™ DSP core bonded to external pins. These pins serve in one of two functions: EMIF address bus (EMIF.A[15:14]), or general-purpose I/O (GPIO.A[15:14]). The initial state of these pins depends on the GPIO0 pin. The address bus has a bus holder feature that eliminates passive component requirement and the power dissipation associated with them. The bus holders keep the address bus at the previous logic level when the bus goes into a high-impedance state.	BK	GPIO0 = 1: Output, EMIF.A[15:14] GPIO0 = 0: Reserved
	EMIF.A[15:14]	O/Z	EMIF address bus. EMIF.A[15:14] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 01. This setting enables the full EMIF mode and the EMIF drives the parallel port address bus.		
	GPIO.A[15:14]	I/O/Z	General-purpose I/O address bus. GPIO.A[15:14] is selected when the Parallel Port Mode bit field is 00, enabling the Data EMIF mode.		
A[20:16] (BGA only)	EMIF.A[20:16]	O/Z	EMIF address bus. At reset, these address pins are set as output. NOTE: These pins only function as EMIF address pins and they are not multiplexed for any other function.		Output
D[15:0]		I/O/Z	A subset of the parallel bidirectional data bus D31–D0 of the C55x™ DSP core. These pins serve as EMIF data bus (EMIF.D[15:0]). The initial state of these pins depends on the GPIO0 pin. The data bus includes bus keepers to reduce the static power dissipation caused by floating, unused pins. This eliminates the need for external bias resistors on unused pins. When the data bus is not being driven by the CPU, the bus keepers keep the pins at the logic level that was most recently driven. (The data bus keepers are enabled at reset, and can be enabled/disabled under software control.)	BK	GPIO0 = 1: Input, EMIF.D[15:0] GPIO0 = 0: Reserved
	EMIF.D[15:0]	I/O/Z	EMIF data bus. EMIF.D[15:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01.		

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS (CONTINUED)					
C0		O/Z	EMIF asynchronous memory read enable. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.ARE
	EMIF.ARE	O/Z	Active-low EMIF asynchronous memory read enable. EMIF.ARE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01.		GPIO0 = 0: Reserved
C1		O/Z	EMIF asynchronous memory output enable . The initial state of this pin depends on the GPIO0 pin.		GPIO0 = 1: Output, EMIF.AOE
	EMIF.AOE	O/Z	Active-low asynchronous memory output enable. EMIF.AOE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01.		GPIO0 = 0: Reserved
C2		O/Z	EMIF asynchronous memory write enable . The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.AWE
	EMIF.AWE	O/Z	Active-low EMIF asynchronous memory write enable. EMIF.AWE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01.		GPIO0 = 0: Reserved
C3		I/Z	EMIF data ready input. The initial state of this pin depends on the GPIO0 pin.	H	GPIO0 = 1: Input, EMIF.ARDY
	EMIF.ARDY	I	EMIF data ready input. Used to insert wait states for slow memories. EMIF.ARDY is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. When this pin is used as ARDY, an external 2.2 kΩ pull-up resistor is recommended.		GPIO0 = 0: Reserved

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS (CONTINUED)					
C4		O/Z	EMIF chip select for memory space CE0. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.CE0
	EMIF.CE0	O/Z	Active-low EMIF chip select for memory space CE0. EMIF.CE0 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		GPIO0 = 0: Reserved
C5		O/Z	EMIF chip select for memory space CE1. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.CE1
	EMIF.CE1	O/Z	Active-low EMIF chip select for memory space CE1. EMIF.CE1 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		GPIO0 = 0: Reserved
C6		O/Z	EMIF chip select for memory space CE2. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.CE2
	EMIF.CE2	O/Z	Active-low EMIF chip select for memory space CE2. EMIF.CE2 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		GPIO0 = 0: Reserved
C7		O/Z	EMIF chip select for memory space CE3. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.CE3
	EMIF.CE3	O/Z	Active-low EMIF chip select for memory space CE3. EMIF.CE3 is selected when the Parallel Port Mode bit field is of the External Bus Selection Register set to 00 or 01.		GPIO0 = 0: Reserved

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS (CONTINUED)					
C8		O/Z	EMIF byte enable 0 control . The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF. $\overline{\text{BE0}}$ GPIO0 = 0: Reserved
	EMIF. $\overline{\text{BE0}}$	O/Z	Active-low EMIF byte enable 0 control. EMIF. $\overline{\text{BE0}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		
C9		O/Z	EMIF byte enable 1 control. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF. $\overline{\text{BE1}}$ GPIO0 = 0: Reserved
	EMIF. $\overline{\text{BE1}}$	O/Z	Active-low EMIF byte enable 1 control. EMIF. $\overline{\text{BE1}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		
C10		O/Z	EMIF SDRAM row strobe. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF. $\overline{\text{SDRAS}}$ GPIO0 = 0: Reserved
	EMIF. $\overline{\text{SDRAS}}$	O/Z	Active-low EMIF SDRAM row strobe. EMIF. $\overline{\text{SDRAS}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/†	FUNCTION	BK‡	RESET CONDITION
PARALLEL BUS (CONTINUED)					
C11		O/Z	EMIF SDRAM column strobe. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.SDCAS GPIO0 = 0: Reserved
	EMIF.SDCAS	O/Z	Active-low EMIF SDRAM column strobe. EMIF.SDCAS is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		
C12		O/Z	EMIF SDRAM write enable. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.SDWE GPIO0 = 0: Reserved
	EMIF.SDWE	O/Z	EMIF SDRAM write enable. EMIF.SDWE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		
C13		O/Z	SDRAM A10 address line. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.SDA10 GPIO0 = 0: Reserved
	EMIF.SDA10	O/Z	SDRAM A10 address line. Address line/autoprecharge disable for SDRAM memory. Serves as a row address bit (logically equivalent to A12) during ACTV commands and also disables the autoprecharging function of SDRAM during read or write operations. EMIF.SDA10 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		
C14		O/Z	Memory interface clock for SDRAM. The initial state of this pin depends on the GPIO0 pin.	BK	GPIO0 = 1: Output, EMIF.CLKMEM GPIO0 = 0: Reserved
	EMIF.CLKMEM	O/Z	Memory interface clock for SDRAM. EMIF.CLKMEM is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01.		

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
INTERRUPT AND RESET PINS					
$\overline{\text{INT}}[4:0]$		I	Active-low external user interrupt inputs. $\overline{\text{INT}}[4:0]$ are maskable and are prioritized by the interrupt enable register (IER) and the interrupt mode bit.	H, FS	Input
$\overline{\text{RESET}}$		I	Active-low reset. $\overline{\text{RESET}}$ causes the digital signal processor (DSP) to terminate execution and forces the program counter to FF8000h. When $\overline{\text{RESET}}$ is brought to a high level, execution begins at location FF8000h of program memory. $\overline{\text{RESET}}$ affects various registers and status bits. Use an external pullup resistor on this pin.	H, FS	Input
BIT I/O SIGNALS					
GPIO[7:6,4:0] (LQFP) GPIO[7:0] (BGA)		I/O/Z	7-bit (LQFP package) or 8-bit (BGA package) Input/Output lines that can be individually configured as inputs or outputs, and also individually set or reset when configured as outputs. At reset, these pins are configured as inputs. After reset, the on-chip bootloader samples GPIO[3:0] to determine the boot mode selected.	BK (GPIO5 only) H (except GPIO5)	Input Input (GPIO4)
	EMIF.CKE (GPIO4)	O/Z	SDRAM CKE signal. The GPIO4 pin can be configured to serve as SDRAM CKE pin by setting the following bits in the External Bus Selection Register: CKE SEL = 1 and CKE EN = 1. In default mode, this pin serves as GPIO4.		
XF		O/Z	External flag. XF is set high by the BSET XF instruction, set low by BCLR XF instruction or by loading ST1. XF is used for signaling other processors in multiprocessor configurations or used as a general-purpose output pin. XF goes into the high-impedance state when $\overline{\text{OFF}}$ is low, and is set high following reset.		Output
	EMIF.CKE	O/Z	SDRAM CKE signal. The XF pin can be configured to serve as SDRAM CKE pin by setting the following bits in the External Bus Selection Register: CKE SEL = 0 and CKE EN = 1. In default mode, this pin serves as XF.		Output (XF)
OSCILLATOR/CLOCK SIGNALS					
CLKOUT		O/Z	DSP clock output signal. CLKOUT cycles at the machine-cycle rate of the CPU. CLKOUT goes into high-impedance state when $\overline{\text{OFF}}$ is low.		Output
X2/CLKIN		I/O	System clock/oscillator input. If the internal oscillator is not being used, X2/CLKIN functions as the clock input. NOTE: The USB module requires a 48 MHz clock. Since this input clock is used by both the CPU PLL and the USB module PLL, it must be a factor of 48 MHz in order for the programmable PLL to produce the required 48 MHz USB module clock. In CLKGEN domain idle (OSC IDLE) mode, this pin becomes output and is driven low to stop external crystals (if used) from oscillating or an external clock source from driving the DSP's internal logic.		Oscillator Input
X1		O	Output pin from the internal system oscillator for the crystal. If the internal oscillator is not used, X1 should be left unconnected. X1 does not go into the high-impedance state when $\overline{\text{OFF}}$ is low.		Oscillator Output

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
TIMER SIGNALS					
TIN/TOUT0		I/O/Z	Timer0 Input/Output. When output, TIN/TOUT0 signals a pulse or a change of state when the on-chip timer counts down past zero. When input, TIN/TOUT0 provides the clock source for the internal timer module. At reset, this pin is configured as an input. NOTE: Only the Timer0 signal is brought out. The Timer1 signal is terminated internally and is not available for external use.	H	Input
REAL-TIME CLOCK					
RTCINX1		I	Real-Time Clock Oscillator input		Input
RTCINX2		O	Real-Time Clock Oscillator output		Output
I²C					
SDA		I/O/Z	I ² C (bidirectional) data. At reset, this pin is in high-impedance mode.	H	Hi-Z
SCL		I/O/Z	I ² C (bidirectional) clock. At reset, this pin is in high-impedance mode.	H	Hi-Z
MULTICHANNEL BUFFERED SERIAL PORTS SIGNALS					
CLKR0		I/O/Z	McBSP0 receive clock. CLKR0 serves as the serial shift clock for the serial port receiver. At reset, this pin is in high-impedance mode.	H	Hi-Z
DR0		I	McBSP0 receive data	FS	Input
FSR0		I/O/Z	McBSP0 receive frame synchronization. The FSR0 pulse initiates the data receive process over DR0. At reset, this pin is in high-impedance mode.		Hi-Z
CLKX0		I/O/Z	McBSP0 transmit clock. CLKX0 serves as the serial shift clock for the serial port transmitter. The CLKX0 pin is configured as input after reset.	H	Input
DX0		O/Z	McBSP0 transmit data. DX0 is placed in the high-impedance state when not transmitting, when RESET is asserted, or when OFF is low.		Hi-Z
FSX0		I/O/Z	McBSP0 transmit frame synchronization. The FSX0 pulse initiates the data transmit process over DX0. Configured as an input following reset.		Input
CLKR1		I/O/Z	McBSP1 receive clock. CLKR1 serves as the serial shift clock for the serial port receiver.	H	Input
DR1		I/Z	McBSP1 serial data receive		Input
FSR1		I/Z	McBSP1 receive frame synchronization. The FSR1 pulse initiates the data receive process over DR1.		Input
DX1		O/Z	McBSP1 serial data transmit. DX1 is placed in the high-impedance state when not transmitting, when RESET is asserted, or when OFF is low.	BK	Hi-Z
CLKX1		I/O/Z	McBSP1 transmit clock. CLKX1 serves as the serial shift clock for the serial port transmitter. The CLKX1 pin is configured as input after reset.	H	Input
FSX1		I/O/Z	McBSP1 transmit frame synchronization. The FSX1 pulse initiates the data transmit process over DX1. Configured as an input following reset.		Input

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
MULTICHANNEL BUFFERED SERIAL PORTS SIGNALS (CONTINUED)					
CLKR2		I/O/Z	McBSP2 receive clock. CLKR2 serves as the serial shift clock for the serial port receiver.	H	Input
DR2		I	McBSP2 serial data receive		Input
FSR2		I	McBSP2 receive frame synchronization. The FSR2 pulse initiates the data receive process over DR2.		Input
DX2		O/Z	McBSP2 serial data transmit. DX2 is placed in the high-impedance state when not transmitting, when RESET is asserted, or when OFF is low.	BK	Hi-Z
CLKX2		I/O/Z	McBSP2 transmit clock. CLKX2 serves as the serial shift clock for the serial port transmitter. The CLKX2 pin is configured as input after reset.	H	Input
FSX2		I/O/Z	McBSP2 frame synchronization. The FSX2 pulse initiates the data transmit process over DX2. FSX2 is configured as an input following reset.		Input
USB					
DP		I/O/Z	Differential (positive) receive/transmit. At reset, this pin is configured as input.		Input
DN		I/O/Z	Differential (negative) receive/transmit. At reset, this pin is configured as input.		Input
PU		O/Z	Pullup output. This pin is used to pull up the detection resistor required by the USB specification. The pin is internally connected to USBV _{DD} via a software controllable switch (CONN bit of the USBCTL register).		Hi-Z

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2–3. Signal Descriptions (Continued)

TERMINAL NAME	MULTIPLEXED SIGNAL NAME	I/O/Z†	FUNCTION	BK‡	RESET CONDITION
TEST/EMULATION PINS					
TCK		I	IEEE standard 1149.1 test clock. TCK is normally a free-running clock signal with a 50% duty cycle. The changes on test access port (TAP) of input signals TMS and TDI are clocked into the TAP controller, instruction register, or selected test data register on the rising edge of TCK. Changes at the TAP output signal (TDO) occur on the falling edge of TCK.	PU H	Input
TDI		I	IEEE standard 1149.1 test data input. Pin with internal pullup device. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK.	PU	Input
TDO		O/Z	IEEE standard 1149.1 test data output. The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. TDO is in the high-impedance state except when the scanning of data is in progress.		Hi-Z
TMS		I	IEEE standard 1149.1 test mode select. Pin with internal pullup device. This serial control input is clocked into the TAP controller on the rising edge of TCK.	PU	Input
$\overline{\text{TRST}}$		I	IEEE standard 1149.1 test reset. $\overline{\text{TRST}}$, when high, gives the IEEE standard 1149.1 scan system control of the operations of the device. If $\overline{\text{TRST}}$ is not connected or driven low, the device operates in its functional mode, and the IEEE standard 1149.1 signals are ignored. This pin has an internal pulldown.	PD FS	Input
EMU0		I/O/Z	Emulator 0 pin. When $\overline{\text{TRST}}$ is driven low, EMU0 must be high for activation of the $\overline{\text{OFF}}$ condition. When $\overline{\text{TRST}}$ is driven high, EMU0 is used as an interrupt to or from the emulator system and is defined as I/O by way of the IEEE standard 1149.1 scan system.	PU	Input
EMU1/ $\overline{\text{OFF}}$		I/O/Z	Emulator 1 pin/disable all outputs. When $\overline{\text{TRST}}$ is driven high, EMU1/ $\overline{\text{OFF}}$ is used as an interrupt to or from the emulator system and is defined as I/O by way of IEEE standard 1149.1 scan system. When $\overline{\text{TRST}}$ is driven low, EMU1/ $\overline{\text{OFF}}$ is configured as $\overline{\text{OFF}}$. The EMU1/ $\overline{\text{OFF}}$ signal, when active-low, puts all output drivers into the high-impedance state. Note that $\overline{\text{OFF}}$ is used exclusively for testing and emulation purposes (not for multiprocessing applications). Therefore, for the $\overline{\text{OFF}}$ condition, the following apply: $\overline{\text{TRST}}$ = low, EMU0 = high, EMU1/ $\overline{\text{OFF}}$ = low	PU	Input

† I = Input, O = Output, S = Supply, Hi-Z = High-impedance

‡ BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

3 Functional Overview

The following functional overview is based on the block diagram in Figure 3–1.

† Number of pins determined by package type.

Figure 3–1. Block Diagram of the TMS320VC5506

3.1 Memory

The 5506 supports a unified memory map (program and data accesses are made to the same physical space). The total useable on-chip memory is 128K bytes (64K 16-bit words of RAM). There is 32K 16-bit words of ROM used by the on-chip boot loader.

3.1.1 On-Chip Dual-Access RAM (DARAM)

The DARAM is located in the byte address range 000000h–00FFFFh and is composed of eight blocks of 8K bytes each (see Table 3–1). Each DARAM block can perform two accesses per cycle (two reads, two writes, or a read and a write). DARAM can be accessed by the internal program, data, or DMA buses.

Table 3–1. DARAM Blocks

BYTE ADDRESS RANGE	MEMORY BLOCK
000000h – 001FFFh	DARAM 0†
002000h – 003FFFh	DARAM 1
004000h – 005FFFh	DARAM 2
006000h – 007FFFh	DARAM 3
008000h – 009FFFh	DARAM 4
00A000h – 00BFFFh	DARAM 5
00C000h – 00DFFFh	DARAM 6
00E000h – 00FFFFh	DARAM 7

† First 192 bytes are reserved for Memory-Mapped Registers (MMRs).

3.1.2 On-Chip Single-Access RAM (SARAM)

The SARAM is located at the byte address range 010000h–01FFFFh and is composed of 8 blocks of 8K bytes each (see Table 3–2). Each SARAM block can perform one access per cycle (one read or one write). SARAM can be accessed by the internal program, data, or DMA buses.

Table 3–2. SARAM Blocks

BYTE ADDRESS RANGE	MEMORY BLOCK
010000h – 011FFFh	SARAM 0
012000h – 013FFFh	SARAM 1
014000h – 015FFFh	SARAM 2
016000h – 017FFFh	SARAM 3
018000h – 019FFFh	SARAM 4
01A000h – 01BFFFh	SARAM 5
01C000h – 01DFFFh	SARAM 6
01E000h – 01FFFFh	SARAM 7

3.1.3 On-Chip Boot Loader Read-Only Memory (ROM)

The one-wait-state ROM is located at the byte address range FF0000h–FFFFFFh, for a total of 64K bytes of ROM used by the on-chip boot loader. The ROM address space can be mapped by software to the external memory or to the internal ROM.

The standard 5506 device includes a bootloader program resident in the ROM. When the MPNMC bit field of the ST3 status register is set through software, the on-chip ROM is disabled and not present in the memory map, and byte address range FF0000h–FFFFFFh is directed to external memory space. A hardware reset always clears the MPNMC bit, so it is not possible to disable the ROM at reset. However, the software reset instruction does not affect the MPNMC bit. The on-chip ROM can be accessed by the program, data, or DMA buses. The first 16-bit word access to ROM requires three cycles. Subsequent accesses require two cycles per 16-bit word.

3.1.4 Memory Maps

3.1.4.1 PGE Package Memory Map

The PGE package features 14 address bits representing 32K-/16K-byte linear address for asynchronous memories per CE space. Due to address row/column multiplexing, address reach for SDRAM devices is 4M bytes for each CE space. The largest SDRAM device that can be used with the 5506 in a PGE package is 128M-bit SDRAM.

Byte Address (Hex) [†]	Memory Blocks	Block Size
000000	MMR (Reserved)	
0000C0	DARAM	(32K – 192) Bytes
008000	DARAM [‡]	32K Bytes
010000	SARAM [§]	64K Bytes
020000	Reserved	
040000	External [¶] – $\overline{CE0}$	32K/16K Bytes – Asynchronous [☆] 4M Bytes – 128K Bytes SDRAM [#]
400000	External [¶] – $\overline{CE1}$	32K/16K Bytes – Asynchronous [☆] 4M Bytes – SDRAM
800000	External [¶] – $\overline{CE2}$	32K/16K Bytes – Asynchronous [☆] 4M Bytes – SDRAM
C00000	External [¶] – $\overline{CE3}$	32K/16K Bytes – Asynchronous [☆] 4M Bytes – SDRAM (MPNMC = 1) 4M Bytes – 64K Bytes if internal ROM selected (MPNMC = 0)
FF0000	ROM (if MPNMC=0) External [¶] – $\overline{CE3}$ (if MPNMC=1)	64K Bytes
FFFFFF		

[†] Address shown represents the first byte address in each block.

[‡] Dual-access RAM (DARAM): two accesses per cycle per block, 8 blocks of 8K bytes.

[§] Single-access RAM (SARAM): one access per cycle per block, 8 blocks of 8K bytes.

[¶] External memory spaces are selected by the chip-enable signal shown ($\overline{CE}[0:3]$). Supported memory types include: asynchronous static RAM (SRAM) and synchronous DRAM (SDRAM).

[#] The minus 128K bytes consists of 32K-byte DARAM access, 32K-byte DARAM, and 64K-byte SARAM.

^{||} Read-only memory (ROM): one access every two cycles.

[☆] 32K bytes for 16-bit-wide memory. 16K bytes for 8-bit-wide memory.

Figure 3–2. TMS320VC5506 Memory Map (PGE Package)

3.1.4.2 GHH and ZHH Package(s) Memory Map

The GHH and ZHH package(s) features 21 address bits representing 2M-byte linear address for asynchronous memories per CE space. Due to address row/column multiplexing, address reach for SDRAM devices is 4M bytes for each CE space. The largest SDRAM device that can be used with the 5506 in a GHH and ZHH package is 128M-bit SDRAM.

Byte Address (Hex) [†]	Memory Blocks	Block Size		
000000	MMR (Reserved)			
0000C0				
008000	DARAM	(32K – 192) Bytes

800000	External¶ – $\overline{CE1}$	2M Bytes – Asynchronous 4M Bytes – SDRAM		
C00000	External¶ – $\overline{CE2}$	2M Bytes – Asynchronous 4M Bytes – SDRAM		
FF0000	External¶ – $\overline{CE3}$	2M Bytes – Asynchronous 4M Bytes – SDRAM (MPNMC = 1) 4M Bytes – 64K Bytes if internal ROM selected (MPNMC = 0)		
FFFFFF	<table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">ROM (if MPNMC=0)</td> <td style="width: 50%;">External¶ – $\overline{CE3}$ (if MPNMC=1)</td> </tr> </table>	ROM (if MPNMC=0)	External¶ – $\overline{CE3}$ (if MPNMC=1)	64K Bytes
ROM (if MPNMC=0)	External¶ – $\overline{CE3}$ (if MPNMC=1)			

[†] Address shown represents the first byte address in each block.

[‡] Dual-access RAM (DARAM): two accesses per cycle per block, 8 blocks of 8K bytes.

[§] Single-access RAM (SARAM): one access per cycle per block, 8 blocks of 8K bytes.

[¶] External memory spaces are selected by the chip-enable signal shown ($\overline{CE}[0:3]$). Supported memory types include: asynchronous static RAM (SRAM) and synchronous DRAM (SDRAM).

[#] The minus 128K bytes consists of 32K-byte DARAM access, 32K-byte DARAM, and 64K-byte SARAM.

^{||} Read-only memory (ROM): one access every two cycles.

Figure 3–3. TMS320VC5506 Memory Map (GHH and ZHH Packages)

3.1.5 Boot Configuration

The on-chip bootloader provides a method to transfer application code and tables from an external source to the on-chip RAM memory at power up. These options include:

- External asynchronous memory boot (via the EMIF) from 8-bit-wide or 16-bit-wide memory
- Serial port boot (from McBSP0) with 8-bit or 16-bit data length
- Serial EPROM boot (from McBSP0) supporting EPROMs with 16-bit or 24-bit address
- USB boot
- I²C EEPROM
- Direct execution from external 16-bit-wide asynchronous memory

External pins select the boot configuration. The values of GPIO[3:0] are sampled, following reset, upon execution of the on-chip bootloader code. It is not possible to disable the bootloader at reset because the 5506 always starts execution from the on-chip ROM following a hardware reset. A summary of boot configurations is shown in Table 3–3. For more information on using the bootloader, see the *Using the TMS320VC5503/VC5507/VC5509/VC5509A Bootloader* application report (literature number SPRA375).

Table 3–3. Boot Configuration Summary

GPIO0	GPIO3	GPIO2	GPIO1	BOOT MODE PROCESS
0	0	0	0	Reserved
0	0	0	1	Serial (SPI) EPROM Boot (24-bit address) via McBSP0
0	0	1	0	USB
0	0	1	1	I ² C EEPROM (7-bit address)
0	1	0	0	Reserved
0	1	0	1	Reserved
0	1	1	0	Reserved
0	1	1	1	Reserved
1	0	0	0	Execute from 16-bit-wide asynchronous memory (on CE1 space)
1	0	0	1	Serial (SPI) EPROM Boot (16-bit address) via McBSP0
1	0	1	0	8-bit asynchronous memory (on CE1 space)
1	0	1	1	16-bit asynchronous memory (on CE1 space)
1	1	0	0	Reserved
1	1	0	1	Reserved
1	1	1	0	Standard serial boot via McBSP0 (16-bit data)
1	1	1	1	Standard serial boot via McBSP0 (8-bit data)

3.2 Peripherals

The 5506 supports the following peripherals:

- 16-bit external memory interface (EMIF) for asynchronous memory and/or SDRAM
- A six-channel direct memory access (DMA) controller
- A programmable phase-locked loop clock generator
- Two 20-bit timers
- Watchdog Timer
- Three multichannel buffered serial ports (McBSPs)
- Seven (LQFP) or Eight (BGA) configurable general-purpose I/O pins
- USB full-speed slave interface supporting:
 - Bulk
 - Interrupt
 - Isochronous
- I²C multi-master and slave interface (I²C compatible except, no fail-safe I/O buffers)
- Real-time clock with crystal input, separate clock domain and supply pins

For detailed information on the C55x™ DSP peripherals, see the following documents:

- *TMS320C55x™ DSP Functional Overview* (literature number SPRU312)
- *TMS320C55x DSP Peripherals Overview Reference Guide* (literature number SPRU317)

3.3 Direct Memory Access (DMA) Controller

The 5506 DMA provides the following features:

- Four standard ports, one for each of the following data resources: DARAM, SARAM, Peripherals and External Memory
- Six channels, which allow the DMA controller to track the context of six independent DMA channels
- Programmable low/high priority for each DMA channel
- One interrupt for each DMA channel
- Event synchronization. DMA transfers in each channel can be dependent on the occurrence of selected events.
- Programmable address modification for source and destination addresses
- Dedicated Idle Domain allows the DMA controller to be placed in a low-power (idle) state under software control.

The 5506 DMA controller allows transfers to be synchronized to selected events. The 5506 supports 15 separate sync events and each channel can be tied to separate sync events independent of the other channels. Sync events are selected by programming the SYNC field in the channel-specific DMA Channel Control Register (DMA_CCR).

3.3.1 DMA Channel Control Register (DMA_CCR)

The channel control register (DMA_CCR) bit layouts are shown in Figure 3–4.

15	14	13	12	11	10	9	8
DST AMODE		SRC AMODE		END PROG	Reserved	REPEAT	AUTO INIT
R/W, 00		R/W, 00		R/W, 0	R, 0	R/W, 0	R/W, 0
7	6	5	4	0			
EN	PRIO	FS	SYNC				
R/W, 0	R/W, 0	R/W, 0	R/W, 00000				

Legend: R = Read, W = Write, *n* = value after reset

Figure 3–4. DMA_CCR Bit Locations

The SYNC[4:0] bits specify the event that can initiate the DMA transfer for the corresponding DMA channel. The five bits allow several configurations as listed in Table 3–4. The bits are set to zero upon reset. For those synchronization modes with more than one peripheral listed, the Serial Port Mode bit field of the External Bus Selection Register dictates which peripheral event is actually connected to the DMA input.

Table 3–4. Synchronization Control Function

SYNC FIELD IN DMA_CCR	SYNCHRONIZATION MODE
00000b	No event synchronized
00001b	McBSP 0 Receive Event (REVT0)
00010b	McBSP 0 Transmit Event (XEVT0)
00011b	Reserved. These bits should always be written with 0.
00100b	Reserved. These bits should always be written with 0.
00101b	McBSP1 Receive Event (REVT1)
00110b	McBSP1 Transmit Event (XEVT1)
00111b	Reserved. These bits should always be written with 0.
01000b	Reserved. These bits should always be written with 0.
01001b	McBSP2 Receive Event (REVT2)
01010b	McBSP2 Transmit Event (XEVT2)
01011b	Reserved. These bits should always be written with 0.
01100b	Reserved. These bits should always be written with 0.
01101b	Timer 0 Interrupt Event
01110b	Timer 1 Interrupt Event
01111b	External Interrupt 0
10000b	External Interrupt 1
10001b	External Interrupt 2
10010b	External Interrupt 3
10011b	External Interrupt 4 / I ² C Receive Event (REVTI2C) [†]
10100b	I ² C Transmit Event (XEVTI2C)
Other values	Reserved (Do not use these values)

[†] The I²C receive event (REVTI2C) and external interrupt 4 (INT4) share a synchronization input to the DMA. When the SYNC field of the DMA_CCR is set to 10011b, the logical OR of these two sources is used for DMA synchronization.

3.4 I²C Interface

The TMS320VC5506 includes an I²C serial port. The I²C port supports:

- Compatible with Philips I²C Specification Revision 2.1 (January 2000)
- Operates at 100 Kbps or 400 Kbps
- 7-bit addressing mode
- Master (transmit/receive) and slave (transmit/receive) modes of operation
- Events: DMA, interrupt, or polling

The I²C module clock *must* be in the range from 7 MHz to 12 MHz. This is necessary for proper operation of the I²C module. With the I²C module clock in this range, the noise filters on the SDA and SCL pins suppress noise that has a duration of 50 ns or shorter. The I²C module clock is derived from the DSP clock divided by a programmable prescaler.

NOTE: I/O buffers are *not* fail-safe. The SDA and SCL pins could potentially draw current if the device is powered down and SDA and SCL are driven by other devices connected to the I²C bus.

3.5 Configurable External Buses

The 5506 offers combinations of configurations for its external parallel port. This allows the system designer to choose the appropriate media interface for its application without the need of a large-pin-count package. The External Bus Selection Register controls the routing of the parallel port signals.

3.5.1 External Bus Selection Register (EBSR)

The External Bus Selection Register determines the mapping of the 14 (LQFP) or 21 (BGA) address signals, 16 data signals, and 15 control signals of the external parallel port. The External Bus Selection Register is memory-mapped at port address 0x6C00. Once the bit fields of this register are changed, the routing of the signals takes place on the next CPU clock cycle.

The reset value of the parallel port mode bit field is determined by the state of the GPIO0 pin at reset. If GPIO0 is high at reset, the full EMIF mode is enabled and the parallel port mode bit field is set to 01. Dynamic switching of the parallel port, once configured, is not recommended.

15	14	13	12	11	10	9	8	
CLKOUT Disable	OSC Disable	Reserved	$\overline{\text{BKE}}$	SR STAT	HOLD	HOLDA	CKE SEL	
R/W, 0	R/W, 0	R/W, 0	R/W, 0	R/W, 0	R/W, 0	R/W, 1	R/W, 0	
7	6	5	Reserved (see NOTE)			2	1	0
CKE EN	SR CMD				Parallel Port Mode			
R/W, 0	R/W, 0	R, 0000			R/W, 01 if GPIO0 = 1 at reset; 11 if GPIO0 = 0 at reset			

Legend: R = Read, W = Write, *n* = value after reset

NOTE: These bits are Reserved and must be kept as 0000 during any writes to EBSR.

Figure 3–5. External Bus Selection Register

Table 3–5. External Bus Selection Register Bit Field Description

BITS	DESCRIPTION
15	CLKOUT disable. CLKOUT disable = 0: CLKOUT enabled CLKOUT disable = 1: CLKOUT disabled
14	Oscillator disable. Works with IDLE instruction to put the clock generation domain into IDLE mode. OSC disable = 0: Oscillator enabled OSC disable = 1: Oscillator disabled
13	Reserved
12	Bus keeper enable. [†] $\overline{\text{BKE}}$ = 0: Bus keeper, pullups/pulldowns enabled $\overline{\text{BKE}}$ = 1: Bus keeper, pullups/pulldowns disabled
11	SDRAM self-refresh status bit. SR STAT = 0: SDRAM self-refresh signal is not asserted. SR STAT = 1: SDRAM self-refresh signal is asserted
10	EMIF hold HOLD = 0: DSP drives the external memory bus HOLD = 1: Request the external memory bus to be placed in high-impedance so that another device can drive the memory bus

[†] Function available when the port or pins configured as input.

Table 3–5. External Bus Selection Register Bit Field Description (Continued)

BITS	DESCRIPTION
9	EMIF hold acknowledge. HOLDA = 0: DSP indicates that a hold request on the external memory bus has occurred, the EMIF completed any pending external bus activity, and placed the external memory bus signals in high-impedance state (address bus, data bus, CE[3:0], AOE, AWE, ARE, SDRAS, SDCAS, SDWE, SDA10, CLKMEM). Once this bit is cleared, an external device can drive the bus. HOLDA = 1: No hold acknowledge
8	SDRAM CKE pin selection bit. CKE SEL = 0: Use XF for SDRAM CKE signal CKE SEL = 1: Use GPIO.4 for SDRAM CKE signal
7	SDRAM CKE enable bit. CKE EN = 0: XF or GPIO.4 operates in normal mode CKE EN = 1: Based on the CKE SEL bit, either XF or GPIO.4 drives the SDRAM CKE pin
6	SDRAM self-refresh command. SR CMD = 0: EMIF will not issue a SDRAM self-refresh command SR CMD = 1: EMIF will issue a SDRAM self-refresh command
5–2	Reserved. Must be kept as 0000 during any writes to EBSR.
1–0	Parallel port mode. EMIF/GPIO Mode. Determines the mode of the parallel port. Parallel Port Mode = 00: Data EMIF mode. The 16 EMIF data signals and 13 EMIF control signals are routed to the corresponding external parallel bus data and control signals. The 14 (LQFP) or 16 (BGA) address bus signals can be used as general-purpose I/O only. Parallel Port Mode = 01: Full EMIF mode. The 14 (LQFP) or 21 (BGA) address signals, 16 data signals, and 15 control signals are routed to the corresponding external parallel bus address, data, and control signals. Parallel Port Mode = 10: Reserved Parallel Port Mode = 11: Reserved

† Function available when the port or pins configured as input.

3.5.2 Parallel Port

The parallel port of the 5506 consists of 14 (LQFP) or 21 (BGA) address signals, 16 data signals, and 15 control signals. Its 14 bits for address allow it to access 16K (LQFP) or 2M bytes of external memory when using the asynchronous SRAM interface. On the other hand, the SDRAM interface can access the whole external memory space of 16M bytes. The parallel bus supports two different modes:

- **Full EMIF mode:** the EMIF with its 14 (LQFP) or 21 address signals, 16 data signals, and 15 control signals routed to the corresponding external parallel bus address, data, and control signals.
- **Data EMIF mode:** the EMIF with its 16 data signals, and 15 control signals routed to the corresponding external parallel bus data and control signals. The 14 (LQFP) or 16 (BGA) address bus signals can be used as general-purpose I/O signals only.

† Represents the Parallel Port Mode bits of the External Bus Selection Register.

‡ A[20:16] of the BGA package always functions as EMIF address pins and they cannot be reconfigured for any other function.

3.5.3 Parallel Port Signal Routing

The 5506 allows access to 16-bit-wide (read and write) or 8-bit-wide (read only) asynchronous memory and 16-bit-wide SDRAM. For 16-bit-wide memories, EMIF.A[0] is kept low and is not used. To provide as many address pins as possible, the 5506 routes the parallel port signals as shown in Figure 3–6.

Figure 3–6 shows the addition of the A'[0] signal in the BGA package. This pin is used for asynchronous memory interface only, while the A[0] pin can also be used with the GPIO. Figure 3–7 summarizes the use of the parallel port signals for memory interfacing.

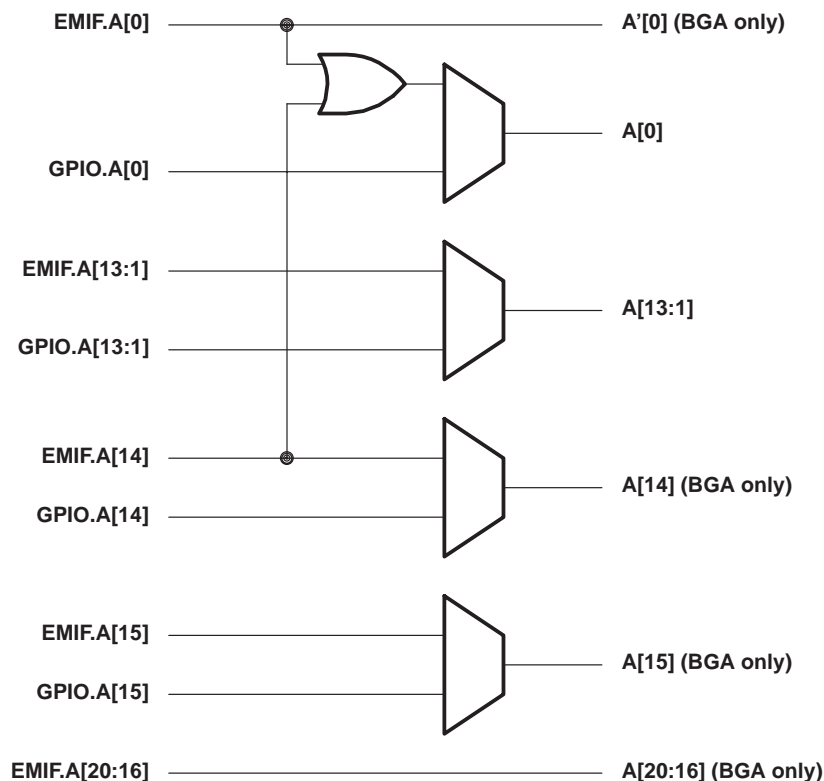

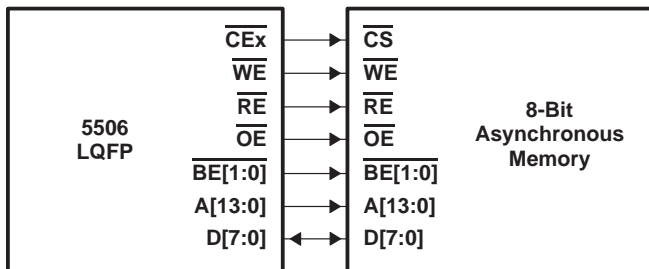

Figure 3–6. Parallel Port Signal Routing

16-Bit-Wide SDRAM

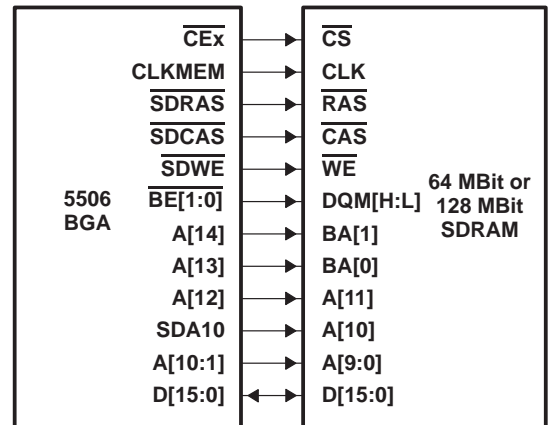

Figure 3-7. Parallel Port (EMIF) Signal Interface

3.6 General-Purpose Input/Output (GPIO) Ports

3.6.1 Dedicated General-Purpose I/O

The 5506 provides eight dedicated general-purpose input/output pins, GPIO0–GPIO7. Each pin can be independently configured as an input or an output using the I/O Direction Register (IODIR). The I/O Data Register (IODATA) is used to monitor the logic state of pins configured as inputs and control the logic state of pins configured as outputs. See Table 3–26 for address information. The description of the IODIR is shown in Figure 3–8 and Table 3–7. The description of IODATA is shown in Figure 3–9 and Table 3–8.

To configure a GPIO pin as an input, clear the direction bit that corresponds to the pin in IODIR to 0. To read the logic state of the input pin, read the corresponding bit in IODATA.

To configure a GPIO pin as an output, set the direction bit that corresponds to the pin in IODIR to 1. To control the logic state of the output pin, write to the corresponding bit in IODATA.

If IOx is configured as an output (IOxDIR = 1 in IODIR): IOxD = 0 Drive the signal on the IOx pin low. IOxD = 1 Drive the signal on the IOx pin high.

[†] The GPIO5 pin is available on the BGA package only.

[‡] *pin* = value present on the pin (IO7–IO0 default to inputs after reset)

3.6.2 Address Bus General-Purpose I/O

The 16 address signals, EMIF.A[15–0], can also be individually enabled as GPIO when the Parallel Port Mode bit field of the External Bus Selection Register is set for Data EMIF (00). These pins are controlled by three registers: the enable register, AGPIOEN, determines if the pins serve as GPIO or address (Figure 3–10); the direction register, AGPIODIR, determines if the GPIO enabled pin is an input or output (Figure 3–11); and the data register, AGPIODATA, determines the logic states of the pins in general-purpose I/O mode (Figure 3–12).

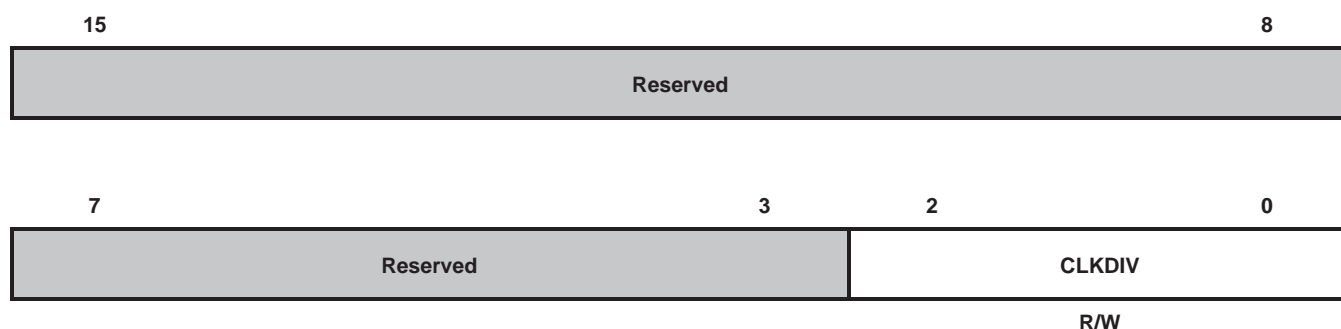

Figure 3–12. Address/GPIO Data Register (AGPIODATA) Bit Layout

Table 3–11. Address/GPIO Data Register (AGPIODATA) Bit Functions

BIT NO.	BIT NAME	RESET VALUE	FUNCTION
15–0	AIODx	0	Data bits that are used to control the level of the Address Bus configured as I/O output pins, and to monitor the level of the Address Bus configured as I/O input pins. AIOD15 and AIOD14 are only available in BGA package. If AIODIRn = 0, then: AIODx = 0 Corresponding I/O pin is read as a low. AIODx = 1 Corresponding I/O pin is read as a high. If AIODIRn = 1, then: AIODx = 0 Set corresponding I/O pin to low. AIODx = 1 Set corresponding I/O pin to high.

3.7 System Register

The system register (SYSR) provides control over certain device-specific functions. The register is located at port address 07FDh.

Legend: R = Read, W = Write, n = value after reset

Figure 3–13. System Register Bit Locations

Table 3–12. System Register Bit Fields

BIT		FUNCTION
NUMBER	NAME	
15–3	Reserved	These bits are reserved and are unaffected by writes.
2–0	CLKDIV	<p>CLKOUT Divide Factor. Allows the clock present on the CLKOUT pin to be a divided-down version of the internal CPU clock. This field does not affect the programming of the PLL.</p> <p>CLKDIV 000 = CLKOUT represents the CPU clock divided by 1 CLKDIV 001 = CLKOUT represents the CPU clock divided by 2 CLKDIV 010 = CLKOUT represents the CPU clock divided by 4 CLKDIV 011 = CLKOUT represents the CPU clock divided by 6 CLKDIV 100 = CLKOUT represents the CPU clock divided by 8 CLKDIV 101 = CLKOUT represents the CPU clock divided by 10 CLKDIV 110 = CLKOUT represents the CPU clock divided by 12 CLKDIV 111 = CLKOUT represents the CPU clock divided by 14</p>

3.8 USB Clock Generation

The USB module can be clocked from either an Analog Phase-Locked Loop (APLL) or a Digital Phase-Locked Loop (DPLL). The APLL is the recommended USB clock source due to better noise tolerance and less long-term jitter than the DPLL. To maintain the backward compatibility, the DPLL is the power-up default clock source for the USB module.

Figure 3–14. USB Clock Generation

Legend: R = Read, W = Write, n = value after reset

Figure 3–15. USB PLL Selection and Status Register Bit Layout

Table 3–13. USB PLL Selection and Status Register Bit Functions

BIT NO.	BIT NAME	RESET VALUE	FUNCTION
15–3	Reserved	0	Reserved bits. Always write 0.
2	DPLLSTAT	1	Status bit indicating if the DPLL is the source for the USB module clock. DPLLSTAT = 0 The DPLL is not the USB module clock source. DPLLSTAT = 1 The DPLL is the USB module clock source.
1	APLLSTAT	0	Status bit indicating if the APLL is the source for the USB module clock. APLLSTAT = 0 The APLL is not the USB module clock source. APLLSTAT = 1 The APLL is the USB module clock source.
0	PLLSEL	0	USB module clock source selection bit. PLLSEL = 0 DPLL is selected as USB module clock source. PLLSEL = 1 APLL is selected as USB module clock source.

Legend: R = Read, W = Write, n = value after reset

Figure 3–16. USB APLL Clock Mode Register Bit Layout

Table 3–14. USB APLL Clock Mode Register Bit Functions

BIT NO.	BIT NAME	RESET VALUE	FUNCTION
15–12	MULT	0	PLL Multiply Factor K. Multiply Factor K, combined with DIV and MODE, determines the final PLL output clock frequency. $K = \text{MULT}[3:0] + 1$
11	DIV	0	PLL Divide Factor (D) selection bit for PLL multiply mode operation. DIV, combined with K and MODE, determines the final PLL output clock frequency. When the PLL is operating in multiply mode: DIV = 0 PLL Divide Factor D = 1 DIV = 1 PLL Divide Factor D = 2 if K is odd PLL Divide Factor D = 4 if K is even
10–3	COUNT	0	8-bit counter for PLL lock timer. When the MODE bit is set to 1, the COUNT field starts decrementing by 1 at the rate of CLKIN/16. When COUNT decrements to 0, the STAT bit is set to 1 and the PLL enabled clock is sourced to the USB module.

Table 3–14. USB APLL Clock Mode Register Bit Functions (Continued)

BIT NO.	BIT NAME	RESET VALUE	FUNCTION												
2	ON	0	<p>PLL Voltage Controlled Oscillator (VCO) enable bit. This bit works in conjunction with MODE to enable or disable the VCO.</p> <table> <thead> <tr> <th>ON</th> <th>MODE</th> <th>VCO</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>OFF</td> </tr> <tr> <td>1</td> <td>X</td> <td>ON</td> </tr> <tr> <td>X</td> <td>1</td> <td>ON</td> </tr> </tbody> </table> <p>X = Don't care</p>	ON	MODE	VCO	0	0	OFF	1	X	ON	X	1	ON
ON	MODE	VCO													
0	0	OFF													
1	X	ON													
X	1	ON													
1	MODE	0	<p>PLL mode selection bit</p> <p>MODE = 0 PLL operating in divide mode (VCO bypassed). When the PLL is operating in DIV mode, the PLL Divide Factor (D) is determined by the factor K.</p> <p style="padding-left: 40px;">D = 2 if K = 1 to 15 D = 4 if K = 16</p> <p>MODE = 1 PLL operating in multiply mode (VCO on). The PLL multiply and divide factors are determined by DIV and K.</p>												
0	STAT	0	<p>PLL lock status bit</p> <p>STAT = 0 PLL operating in DIV mode (VCO bypassed) STAT = 1 PLL operating in multiply mode (VCO on)</p>												

DIV, combined with MODE and K, defines the final PLL multiplication ratio M/D as indicated below. The USB APLL clock frequency can be simply expressed by:

$$F_{\text{USB APLL CLK}} = F_{\text{CLKIN}} \times (M/D)$$

The multiplication factor M and the dividing factor D are defined in Table 3–15.

Table 3–15. M and D Values Based on MODE, DIV, and K

MODE	DIV	K	M	D
0	X	1 to 15	1	2
0	X	16	1	4
1	0	1 to 15	K	1
1	0	16	1	1
1	1	Odd	K	2
1	1	Even	K – 1	4

The USB clock generation and the PLL switching scheme are discussed in detail in the *TMS320VC5507/5509 DSP Universal Serial Bus (USB) Module Reference Guide* (literature number SPRU596) and in the *Using the USB APLL on the TMS320VC5507/5509A Application Report* (literature number SPRA997).

3.9 Memory-Mapped Registers

The 5506 has 78 memory-mapped CPU registers that are mapped in data memory space address 0h to 4Fh. Table 3–16 provides a list of the CPU memory-mapped registers (MMRs) available. The corresponding TMS320C54x™ (C54x™) CPU registers are also indicated where applicable.

Table 3–16. CPU Memory-Mapped Registers

3.10 Peripheral Register Description

Each 5506 device has a set of memory-mapped registers associated with peripherals as listed in Table 3–17 through Table 3–31. Some registers use less than 16 bits. When reading these registers, unused bits are always read as 0.

NOTE: The CPU access latency to the peripheral memory-mapped registers is 6 CPU cycles. Following peripheral register update(s), the CPU must wait at least 6 CPU cycles before attempting to use that peripheral. When more than one peripheral register is updated in a sequence, the CPU only needs to wait following the final register write. For example, if the EMIF is being reconfigured, the CPU must wait until the very last EMIF register update takes effect before trying to access the external memory. The users should consult the respective peripheral user's guide to determine if a peripheral requires additional time to initialize itself to the new configuration after the register updates take effect.

Before reading or writing to the USB register, the USB module has to be brought out of reset by setting bit 2 of the USB Idle Control and Status Register.

Table 3–17. Idle Control, Status, and System Registers

WORD ADDRESS	REGISTER NAME	DESCRIPTION	RESET VALUE†
0x0001	ICR[7:0]	Idle Control Register	xxxx xxxx 0000 0100

Table 3–31. External Bus Selection Register

WORD ADDRESS	REGISTER NAME	DESCRIPTION	RESET VALUE
0x6C00	EBSR[15:0]	External Bus Selection Register	0000 0000 0000 0011†

† The reset value is 0000 0000 0000 0001 if GPIO0 = 1 at reset; the value is 0000 0000 0000 0011 if GPIO0 = 0 at reset.

3.11 Interrupts

Vector-relative locations and priorities for all internal and external interrupts are shown in Table 3–32.

Table 3–32. Interrupt Table

NAME	SOFTWARE (TRAP) EQUIVALENT	RELATIVE LOCATION† (HEX BYTES)	PRIORITY	FUNCTION
RESET	SINT0	0	0	Reset (hardware and software)
NMI‡	SINT1	8	1	Nonmaskable interrupt
BERR	SINT24	C0	2	Bus Error interrupt
INT0	SINT2	10	3	External interrupt #0
INT1	SINT16	80	4	External interrupt #1
INT2	SINT3	18	5	External interrupt #2
TINT0	SINT4	20	6	Timer #0 interrupt
RINT0	SINT5	28	7	McBSP #0 receive interrupt
XINT0	SINT17	88	8	McBSP #0 transmit interrupt
RINT1	SINT6	30	9	McBSP #1 receive interrupt
XINT1	SINT7	38	10	McBSP #1 transmit interrupt
USB	SINT8	40	11	USB interrupt
DMAC0	SINT18	90	12	DMA Channel #0 interrupt
DMAC1	SINT9	48	13	DMA Channel #1 interrupt
Reserved	SINT10	50	14	Reserved
INT3/WDTINT	SINT11	58	15	External interrupt #3 or Watchdog timer interrupt
INT4/RTC§	SINT19	98	16	External interrupt #4 or RTC interrupt
RINT2	SINT12	60	17	McBSP #2 receive interrupt
XINT2	SINT13	68	18	McBSP #2 transmit interrupt
DMAC2	SINT20	A0	19	DMA Channel #2 interrupt
DMAC3	SINT21	A8	20	DMA Channel #3 interrupt
DMAC4	SINT14	70	21	DMA Channel #4 interrupt
DMAC5	SINT15	78	22	DMA Channel #5 interrupt
TINT1	SINT22	B0	23	Timer #1 interrupt
IIC	SINT23	B8	24	I ² C interrupt
DLOG	SINT25	C8	25	Data log interrupt
RTOS	SINT26	D0	26	Real-time Operating System interrupt
–	SINT27	D8	27	Software interrupt #27
–	SINT28	E0	28	Software interrupt #28
–	SINT29	E8	29	Software interrupt #29
–	SINT30	F0	30	Software interrupt #30
–	SINT31	F8	31	Software interrupt #31

† Absolute addresses of the interrupt vector locations are determined by the contents of the IVPD and IVPH registers. Interrupt vectors for interrupts 0–15 and 24–31 are relative to IVPD. Interrupt vectors for interrupts 16–23 are relative to IVPH.

‡ The NMI pin is internally tied high. However, NMI interrupt vector can be used for SINT1 and Watchdog Timer Interrupt.

§ It is recommended that either the INT4 or RTC interrupt be used. If both INT4 and RTC interrupts are used, one interrupt event can potentially hold off the other interrupt. For example, if INT4 is asserted first and held low, the RTC interrupt will not be recognized until the INT4 pin is back to high-logic state again. The INT4 pin must be pulled high if only the RTC interrupt is used.

3.11.1 IFR and IER Registers

The IFR0 (Interrupt Flag Register 0) and IER0 (Interrupt Enable Register 0) bit layouts are shown in Figure 3–17.

15	14	13	12	11	10	9	8
DMAC5	DMAC4	XINT2	RINT2	INT3/ WDTINT	Reserved	DMAC1	USB
R/W	R/W	R/W	R/W	R/W	R/W-0†	R/W	R/W
7	6	5	4	3	2	1	0
XINT1	RINT1	RINT0	TINT0	INT2	INT0	Reserved	
R/W	R/W	R/W	R/W	R/W	R/W		

Legend: R = Read, W = Write, *n* = value after reset

† Always write zero.

Figure 3–17. IFR0 and IER0 Bit Locations

Table 3–33. IFR0 and IER0 Register Bit Fields

BIT		FUNCTION
NUMBER	NAME	
15	DMAC5	DMA channel 5 interrupt flag/mask bit
14	DMAC4	DMA channel 4 interrupt flag/mask bit
13	XINT2	This bit is used as the McBSP2 transmit interrupt flag/mask bit.
12	RINT2	McBSP2 receive interrupt flag/mask bit.
11	INT3/WDTINT	This bit is used as either the external user interrupt 3 flag/mask bit, or the watchdog timer interrupt flag/mask bit.†
10	–	Reserved
9	DMAC1	DMA channel 1 interrupt flag/mask bit
8	USB	USB interrupt flag/mask bit.
7	XINT1	This bit is used as the McBSP1 transmit interrupt flag/mask bit.
6	RINT1	McBSP1 receive interrupt flag/mask bit.
5	RINT0	McBSP0 receive interrupt flag bit
4	TINT0	Timer 0 interrupt flag bit
3	INT2	External interrupt 2 flag bit
2	INT0	External interrupt 0 flag bit
1–0	–	Reserved for future expansion. These bits should always be written with 0.

† It is possible to have active interrupts simultaneously from both the external INT3 source and the watchdog timer. When an interrupt is detected in this bit, the watchdog timer status register should be polled to determine if the watchdog timer is the interrupt source.

The IFR1 (Interrupt Flag Register 1) and IER1 (Interrupt Enable Register 1) bit layouts are shown in Figure 3–18.

NOTE: It is possible to have active interrupts simultaneously from both the external interrupt 4 (INT4) and the real-time clock (RTC). When an interrupt is detected in this bit, the real-time clock status register should be polled to determine if the real-time clock is the source of the interrupt.

Legend: R = Read, W = Write, *n* = value after reset

† Always write zeros.

Figure 3–18. IFR1 and IER1 Bit Locations

Table 3–34. IFR1 and IER1 Register Bit Fields

BIT		FUNCTION
NUMBER	NAME	
15–11	–	Reserved for future expansion. These bits should always be written with 0.
10	RTOS	Real-time operating system interrupt flag/mask bit
9	DLOG	Data log interrupt flag/mask bit
8	BERR	Bus error interrupt flag/mask bit
7	I2C	I2C interrupt flag/mask bit
6	TINT1	Timer 1 interrupt flag/mask bit
5	DMAC3	DMA channel 3 interrupt flag/mask bit
4	DMAC2	DMA channel 2 interrupt flag/mask bit
3	INT4/RTC	This bit can be used as either the external user interrupt 4 flag/mask bit, or the real-time clock interrupt flag/mask bit.
2	DMAC0	DMA channel 0 interrupt flag/mask bit
1	XINT0	McBSP transmit 0 interrupt flag/mask bit
0	INT1	External user interrupt 1 flag/mask bit

3.11.2 Interrupt Timing

The external interrupts ($\overline{\text{INT}}[4:0]$) are synchronized to the CPU by way of a two-flip-flop synchronizer. The interrupt inputs are sampled on falling edges of the CPU clock. A sequence of 1-1-0-0-0 on consecutive cycles on the interrupt pin is required for an interrupt to be detected. Therefore, the minimum low pulse duration on the external interrupts on the 5506 is three CPU clock periods.

3.11.3 Waking Up From IDLE Condition

One of the following four events can wake up the CPU from IDLE:

- Hardware Reset
- External Interrupt
- RTC Interrupt
- USB Event (Reset or Resume)

3.11.3.1 Waking Up From IDLE With Oscillator Disabled

With an external interrupt, a RTC interrupt, or an USB resume/reset, the clock generation circuit wakes up the oscillator and enables the USB PLL to determine the oscillator stable time. In the case of the interrupt being disabled by clearing the associated bit in the Interrupt Enable Register (IERx), the CPU is not “woken up”. If the interrupt due to the wake-up event is enabled, the interrupt is sent to the CPU only after the oscillator is stabilized and the USB PLL is locked. If the external interrupt serves as the wake-up event, the interrupt line must stay low for a minimum of 3 CPU cycles after the oscillator is stabilized to wake up the CPU. Otherwise, only the clock domain will wake up and another external interrupt will be needed to wake up the CPU.

Once out of IDLE, any system not using the USB should put the USB module in idle mode to reduce power consumption.

For more details on the TMS320VC5506 oscillator-disable process, see the *Disabling the Internal Oscillator on the TMS320VC5507/5509/5509A DSP* application report (literature number SPRA078).

4 Support

4.1 Notices Concerning JTAG (IEEE 1149.1) Boundary Scan Test Capability

4.1.1 Initialization Requirements for Boundary Scan Test

The TMS320VC5506 uses the JTAG port for boundary scan tests, emulation capability and factory test purposes. To use boundary scan test, the EMU0 and EMU1/ $\overline{\text{OFF}}$ pins must be held LOW through a rising edge of the $\overline{\text{TRST}}$ signal prior to the first scan. This operation selects the appropriate TAP control for boundary scan. If at any time during a boundary scan test a rising edge of $\overline{\text{TRST}}$ occurs when EMU0 or EMU1/ $\overline{\text{OFF}}$ are not low, a factory test mode may be selected preventing boundary scan test from being completed. For this reason, it is recommended that EMU0 and EMU1/ $\overline{\text{OFF}}$ be pulled or driven low at all times during boundary scan test.

4.1.2 Boundary Scan Description Language (BSDL) Model

BSDL models are available on the web in the TMS320VC5506 product folder under the “simulation models” section.

4.2 Documentation Support

Extensive documentation supports all TMS320™ DSP family of devices from product announcement through applications development. The following types of documentation are available to support the design and use of the TMS320C5000™ platform of DSPs:

- *TMS320C55x™ DSP Functional Overview* (literature number SPRU312)
- Device-specific data sheets and data manuals
- Complete user's guides
- Development support tools
- Hardware and software application reports

TMS320C55x reference documentation includes, but is not limited to, the following:

- *TMS320C55x DSP CPU Reference Guide* (literature number SPRU371)
- *TMS320C55x DSP Mnemonic Instruction Set Reference Guide* (literature number SPRU374)
- *TMS320C55x DSP Algebraic Instruction Set Reference Guide* (literature number SPRU375)
- *TMS320C55x DSP Programmer's Guide* (literature number SPRU376)
- *TMS320C55x DSP Peripherals Overview Reference Guide* (literature number SPRU317)
- *TMS320C55x Optimizing C/C++ Compiler User's Guide* (literature number SPRU281)
- *TMS320C55x Assembly Language Tools User's Guide* (literature number SPRU280)
- *TMS320C55x DSP Library Programmer's Reference* (literature number SPRU422)
- *TMS320VC5507/5509 DSP Universal Serial Bus (USB) Module Reference Guide* (literature number SPRU596)
- *Using the USB APLL on the TMS320VC5507/5509A* Application Report (literature number SPRA997)
- *Using the TMS320VC5503/VC5507/VC5509/VC5509A Bootloader* Application Report (literature number SPRA375)
- *Disabling the Internal Oscillator on the TMS320VC5507/5509/5509A DSP* application report (literature number SPRA078)
- *Using the TMS320C5509/C5509A USB Bootloader* Application Report (literature number SPRA840)

The reference guides describe in detail the TMS320C55x™ DSP products currently available and the hardware and software applications, including algorithms, for fixed-point TMS320™ DSP family of devices.

TMS320 and TMS320C5000 are trademarks of Texas Instruments.

A series of DSP textbooks is published by Prentice-Hall and John Wiley & Sons to support digital signal processing research and education. The TMS320™ DSP newsletter, *Details on Signal Processing*, is published quarterly and distributed to update TMS320™ DSP customers on product information.

Information regarding TI DSP products is also available on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

4.3 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320VC5506GHH**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- TMS** Fully qualified production device

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

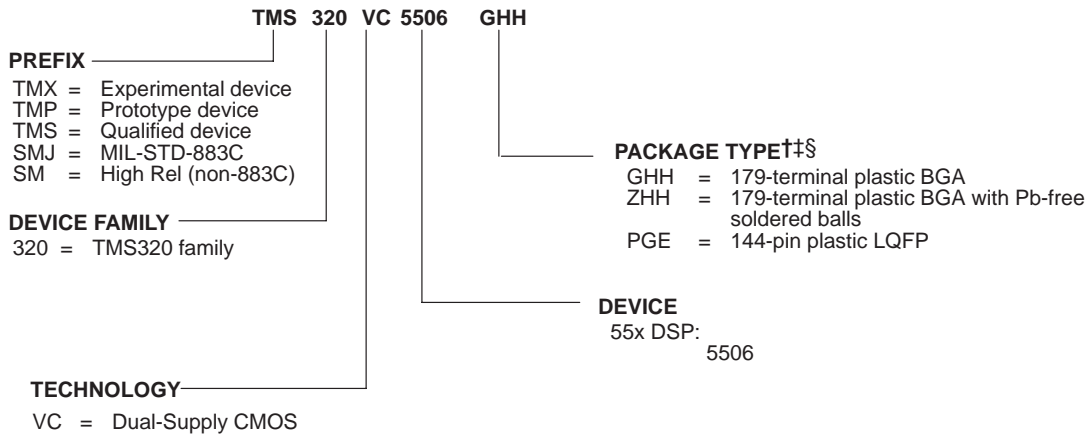

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GHH). The ZHH package, like the GHH package, is a 179-terminal plastic BGA *only* with Pb-free balls. For device part numbers and further ordering information for TMS320VC5506 in the GHH and ZHH package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

4.4 TMS320VC5506 Device Nomenclature

† BGA = Ball Grid Array

LQFP = Low-Profile Quad Flatpack

‡ The ZHH mechanical package designator represents the version of the GHH with Pb-Free soldered balls. The ZHH package devices are supported in the same speed grades as the GHH package devices (**available upon request**).

§ For actual device part numbers (P/Ns) and ordering information, see the Mechanical Data section of this document or the TI website (www.ti.com).

Figure 4–1. Device Nomenclature for the TMS320VC5506

5 Electrical Specifications

This section provides the absolute maximum ratings and the recommended operating conditions for the TMS320VC5506 DSP.

All electrical and switching characteristics in this data manual are valid over the recommended operating conditions unless otherwise specified.

5.1 Absolute Maximum Ratings

The list of absolute maximum ratings are specified over operating case temperature. Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Section 5.2 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to V_{SS} . Figure 5–1 provides the test load circuit values for a 3.3-V I/O.

Supply voltage I/O range, DV_{DD}	– 0.3 V to 4.0 V
Supply voltage core range, CV_{DD}	– 0.3 V to 2.0 V
Input voltage range, V_I	– 0.3 V to 4.5 V
Output voltage range, V_O	– 0.3 V to 4.5 V
Operating case temperature range, T_C	– 40°C to 85°C
Storage temperature range T_{stg}	– 55°C to 150°C

5.2 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Core					
CV _{DD}	Device supply voltage	1.14	1.2	1.26	V
Peripherals					
RCV _{DD}	RTC module supply voltage, core	1.14	1.2	1.26	V
RDV _{DD}	RTC module supply voltage, I/O (RTCINX1 and RTCINX2)	1.14	1.2	1.26	V
USBPLLVD _{DD}	USBPLL supply voltage [†]	1.14	1.2	1.26	V
USBV _{DD}	USB module supply voltage, I/O (DP, DN, and PU)	3	3.3	3.6	V
DV _{DD}	Device supply voltage, I/O (except DP, DN, PU, SDA, SCL) [‡]	2.7	3.3	3.6	V
Grounds					
V _{SS}	Supply voltage, GND, I/O, and core		0		V
USBPLLVS _{SS}	Supply voltage, GND, USBPLL		0		V
V _{IH}	High-level input voltage, I/O	DN and DP [§]	2.0		V
		SDA & SCL: V _{DD} related input levels [‡]	0.7 * DV _{DD}	DV _{DD} (max) + 0.5	
		All other inputs (including hysteresis inputs)	2.0	DV _{DD} + 0.3	
V _{IL}	Low-level input voltage, I/O	DN and DP [§]		0.8	V
		SDA & SCL: V _{DD} related input levels [‡]	-0.5	0.3 * DV _{DD}	
		All other inputs (including hysteresis inputs)	-0.3	0.8	
V _{hys}	Hysteresis level	Inputs with hysteresis only	0.1 * DV _{DD}		V
I _{OH}	High-level output current	DN and DP [§] (V _{OH} = 2.45 V)		-17.0	mA
		All other outputs		-4	
I _{OL}	Low-level output current	DN and DP [§] (V _{OL} = 0.36 V)	17.0		mA
		SDA and SCL [‡]		3	
		All other outputs		4	
T _C	Operating case temperature	-40		85	°C

[†] USB PLL is susceptible to power supply ripple. The maximum allowable supply ripple is 1% for 1 Hz to 5 kHz; 1.5% for 5 kHz to 10 MHz; 3% for 10 MHz to 100 MHz, and less than 5% for 100 MHz or greater.

[‡] The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down. Due to the fact that different voltage devices can be connected to the I²C bus, the level of logic 0 (low) and logic 1 (high) are not fixed and depends on the associated V_{DD}.

[§] USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see Figure 5-34) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.

5.3 Electrical Characteristics

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
V _{OH}	High-level output voltage	DN and DP†	USBV _{DD} = 3.0 V–3.6 V, I _{OH} = –300 μA	2.8	USBV _{DD}	V	
		PU	USBV _{DD} = 3.0 V–3.6 V, I _{OH} = –300 μA	0.9 * USBV _{DD}	USBV _{DD}		
		All other outputs	DV _{DD} = 2.7 V–3.6 V, I _{OH} = MAX	0.75 * DV _{DD}			
V _{OL}	Low-level output voltage	SDA & SCL‡	At 3 mA sink current	0	0.4	V	
		DN and DP†	I _{OL} = 3.0 mA		0.3		
		All other outputs	I _{OL} = MAX		0.4

† USB I/O pins DP and DN can tolerate a short circuit at D+ and D– to 0 V or 5 V, as long as the recommended series resistors (see Figure 5–34) are connected between the D+ and DP (package), and the D– and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.

‡ The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.

§ CPU executing 75% Dual MAC + 25% ADD with moderate data bus activity (table of sine values). CPU and CLKGEN (DPLL) domain are active. All other domains are idled.

¶ One word of a table of a 16-bit sine value is written to the EMIF every 250 ns (64 Mbps). Each EMIF output pin is connected to a 10-pF load.

In CLKGEN domain idle mode, X2/CLKIN becomes output and is driven low to stop external crystals (if used) from oscillating. Standby current will be higher if an external clock source tries to drive the X2/CLKIN pin during this time.

NOTE: The data manual provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data manual timings.

Input requirements in this data manual are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 5–1. 3.3-V Test Load Circuit

5.4 ESD Performance

ESD stress levels were performed in compliance with the following JEDEC standards with the results indicated below:

- Charged Device Model (CDM), based on JEDEC Specification JESD22-C101, passed at ±500 V
- Human Body Model (HBM), based on JEDEC Specification JESD22-A114, passed at ±1500 V

NOTE:

According to industry research publications, ESD-CDM testing results show better correlation to manufacturing line and field failure rates than ESD-HBM testing. 500-V CDM is commonly considered as a safe passing level.

5.5 Timing Parameter Symbology

Timing parameter symbols used in the timing requirements and switching characteristics tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:

a	access time
c	cycle time (period)
d	delay time
dis	disable time
en	enable time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)
X	Unknown, changing, or don't care level

Letters and symbols and their meanings:

H	High
L	Low
V	Valid
Z	High-impedance

5.6 Clock Options

The frequency of the reference clock provided at the X2/CLKIN pin can be divided by a factor of two or four or multiplied by one of several values to generate the internal machine cycle.

5.6.1 Internal System Oscillator With External Crystal

The internal oscillator is always enabled following a device reset. The oscillator requires an external crystal connected across the X1 and X2/CLKIN pins. If the internal oscillator is not used, an external clock source must be applied to the X2/CLKIN pin and the X1 pin should be left unconnected. Since the internal oscillator can be used as a clock source to the PLLs, the crystal oscillation frequency can be multiplied to generate the CPU clock and USB clock, if desired.

The crystal should be in fundamental-mode operation, and parallel resonant, with a maximum effective series resistance (ESR) specified in Table 5–1. The connection of the required circuit is shown in Figure 5–2. Under some conditions, all the components shown are not required. The capacitors, C₁ and C₂, should be chosen such that the equation below is satisfied. C_L in the equation is the load specified for the crystal that is also specified in Table 5–1.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Figure 5–2. Internal System Oscillator With External Crystal

Table 5–1. Recommended Crystal Parameters

FREQUENCY RANGE (MHz)	MAX ESR (Ω)	TYP C _{LOAD} (pF)	MAX C _{SHUNT} (pF)	R _S (Ω)
20–15	20	10	7	0
15–12	30	16	7	0
12–10	40	16	7	100
10–8	60	18	7	470
8–6	80	18	7	1.5k
6–5	80	18	7	2.2k

Although the recommended ESR presented in Table 5–1 is maximum, theoretically a crystal with a lower maximum ESR might seem to meet the requirement. It is recommended that crystals which meet the maximum ESR specification in Table 5–1 are used.

5.6.2 Layout Considerations

Since parasitic capacitance, inductance and resistance can be significant in any circuit, good PC board layout practices should always be observed when planning trace routing to the discrete components used in the oscillator circuit. Specifically, the crystal and the associated discrete components should be located as close to the DSP as physically possible. Also, X1 and X2/CLKIN traces should be separated as soon as possible after routing away from the DSP to minimize parasitic capacitance between them, and a ground trace should be run between these two signal lines. This also helps to minimize stray capacitance between these two signals.

5.6.3 Clock Generation in Bypass Mode (DPLL Disabled)

The frequency of the reference clock provided at the X2/CLKIN pin can be divided by a factor of one, two, or four to generate the internal CPU clock cycle. The divide factor (D) is set in the BYPASS_DIV field of the clock mode register. The contents of this field only affect clock generation while the device is in bypass mode. In this mode, the digital phase-locked loop (DPLL) clock synthesis is disabled.

Table 5–2 and Table 5–3 assume testing over recommended operating conditions and $H = 0.5t_{c(CO)}$ (see Figure 5–3).

Table 5–2. CLKIN Timing Requirements

NO.			MIN	MAX	UNIT
C1	$t_c(CI)$	Cycle time, X2/CLKIN	20	400 [†]	ns
C2	$t_f(CI)$	Fall time, X2/CLKIN		4	ns
C3	$t_r(CI)$	Rise time, X2/CLKIN		4	ns
C10	$t_w(CIL)$	Pulse duration, CLKIN low	6		ns
C11	$t_w(CIH)$	Pulse duration, CLKIN high	6		ns

[†] This device utilizes a fully static design and therefore can operate with $t_c(CI)$ approaching ∞ . If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5–1.

Table 5–3. CLKOUT Switching Characteristics

NO.	PARAMETER	MIN	TYP	MAX	UNIT	
C4	$t_c(CO)$	Cycle time, CLKOUT	20 [‡]	$D \cdot t_c(CI)$ [§]	1600 [†]	ns
C5	$t_d(CI-CO)$	Delay time, X2/CLKIN high to CLKOUT high/low	5	15	25	ns
C6	$t_f(CO)$	Fall time, CLKOUT		1		ns
C7	$t_r(CO)$	Rise time, CLKOUT		1		ns
C8	$t_w(COL)$	Pulse duration, CLKOUT low	H – 1		H + 1	ns
C9	$t_w(COH)$	Pulse duration, CLKOUT high	H – 1		H + 1	ns

[†] This device utilizes a fully static design and therefore can operate with $t_c(CO)$ approaching ∞ . If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5–1.

[‡] It is recommended that the DPLL synthesized clocking option be used to obtain maximum operating frequency.

[§] $D = 1/(\text{PLL Bypass Divider})$

NOTE A: The relationship of X2/CLKIN to CLKOUT depends on the PLL bypass divide factor chosen for the CLKMD register. The waveform relationship shown in Figure 5–3 is intended to illustrate the timing parameters based on $\text{CLKOUT} = 1/2(\text{CLKIN})$ configuration.

Figure 5–3. Bypass Mode Clock Timings

5.6.4 Clock Generation in Lock Mode (DPLL Synthesis Enabled)

The frequency of the reference clock provided at the X2/CLKIN pin can be multiplied by a synthesis factor of N to generate the internal CPU clock cycle. The synthesis factor is determined by:

$$N = \frac{M}{D_L}$$

where: M = the multiply factor set in the PLL_MULT field of the clock mode register

D_L = the divide factor set in the PLL_DIV field of the clock mode register

Valid values for M are (multiply by) 2 to 31. Valid values for D_L are (divide by) 1, 2, 3, and 4.

For detailed information on clock generation configuration, see the *TMS320C55x DSP Peripherals Overview Reference Guide* (literature number SPRU317).

Table 5–4 and Table 5–5 assume testing over recommended operating conditions and H = 0.5t_{c(CO)} (see Figure 5–4).

Table 5–4. Multiply-By-N Clock Option Timing Requirements

NO.			MIN	MAX	UNIT
C1	t _{c(CI)}	Cycle time, X2/CLKIN	DPLL synthesis enabled 20†	400	ns
C2	t _{f(CI)}	Fall time, X2/CLKIN		4	ns
C3	t _{r(CI)}	Rise time, X2/CLKIN		4	ns
C10	t _{w(CIL)}	Pulse duration, CLKIN low	6		ns
C11	t _{w(CIH)}	Pulse duration, CLKIN high	6		ns

† The clock frequency synthesis factor and minimum X2/CLKIN cycle time should be chosen such that the resulting CLKOUT cycle time is within the specified range (t_{c(CO)}). If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5–1.

Table 5–5. Multiply-By-N Clock Option Switching Characteristics

NO.	PARAMETER	MIN	TYP	MAX	UNIT
C4	t _{c(CO)} Cycle time, CLKOUT	9.26	t _{c(CI)} *N‡	1600	ns
C6	t _{f(CO)} Fall time, CLKOUT		1		ns
C7	t _{r(CO)} Rise time, CLKOUT		1		ns
C8	t _{w(COL)} Pulse duration, CLKOUT low	H – 1		H + 1	ns
C9	t _{w(COH)} Pulse duration, CLKOUT high	H – 1		H + 1	ns
C12	t _{d(CI–CO)} Delay time, X2/CLKIN high/low to CLKOUT high/low	5	15	25	ns

‡ N = Clock frequency synthesis factor

NOTE A: The relationship of X2/CLKIN to CLKOUT depends on the PLL multiply and divide factor chosen for the CLKMD register. The waveform relationship shown in Figure 5–3 is intended to illustrate the timing parameters based on CLKOUT = 1xCLKIN configuration.

Figure 5–4. External Multiply-by-N Clock Timings

5.6.5 Real-Time Clock Oscillator With External Crystal

The real-time clock module includes an oscillator circuit. The oscillator requires an external 32.768-kHz crystal connected across the RTCINX1 and RTCINX2 pins. The connection of the required circuit, consisting of the crystal and two load capacitors, is shown in Figure 5–5. The load capacitors, C_1 and C_2 , should be chosen such that the equation below is satisfied. C_L in the equation is the load specified for the crystal.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Figure 5–5. Real-Time Clock Oscillator With External Crystal

NOTE: The RTC can be idled by not supplying its 32-kHz oscillator signal. In order to keep RTC power dissipation to a minimum when the RTC module is not used, it is recommended that the RTC module be powered up, the RTC input pin (RTCINX1) be pulled low, and the RTC output pin (RTCINX2) be left floating.

Table 5–6. Recommended RTC Crystal Parameters

PARAMETER		MIN	NOM	MAX	UNIT
f_o	Frequency of oscillation [†]		32.768		kHz
ESR	Series resistance [†]	30		60	k Ω
C_L	Load capacitance		12.5		pF
DL	Crystal drive level			1	μ W

[†] ESR must be 200 k Ω or greater at frequencies other than 32.768kHz. Otherwise, oscillations at overtone frequencies may occur.

5.7 Memory Interface Timings

5.7.1 Asynchronous Memory Timings

Table 5–7 and Table 5–8 assume testing over recommended operating conditions (see Figure 5–6 and Figure 5–7).

Table 5–7. Asynchronous Memory Cycle Timing Requirements

NO.		MIN	MAX	UNIT
M1	$t_{su}(DV-COH)$ Setup time, read data valid before CLKOUT high [†]	6		ns
M2	$t_h(COH-DV)$ Hold time, read data valid after CLKOUT high	0		ns
M3	$t_{su}(ARDY-COH)$ Setup time, ARDY valid before CLKOUT high [†]	10		ns
M4	$t_h(COH-ARDY)$ Hold time, ARDY valid after CLKOUT high	0		ns

[†] To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does not meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

Table 5–8. Asynchronous Memory Cycle Switching Characteristics

NO.	PARAMETER	MIN	MAX	UNIT
M5	$t_d(COH-CEV)$ Delay time, CLKOUT high to \overline{CEx} valid	-2	4	ns
M6	$t_d(COH-CEIV)$ Delay time, CLKOUT high to \overline{CEx} invalid	-2	4	ns

5.8 Reset Timings

5.8.1 Power-Up Reset (On-Chip Oscillator Active)

Table 5–11 assumes testing over recommended operating conditions (see Figure 5–15).

Table 5–11. Power-Up Reset (On-Chip Oscillator Active) Timing Requirements

NO.		MIN	MAX	UNIT
R1	$t_{h(SUPSTBL-RSTL)}$ Hold time, \overline{RESET} low after oscillator stable†	$3P^{\ddagger}$		ns

† Oscillator stable time depends on the crystal characteristic (i.e., frequency, ESR, etc.) which varies from one crystal manufacturer to another. Based on the crystal characteristics, the oscillator stable time can be in the range of a few to 10s of ms. A reset circuit with 100 ms or more delay time will ensure the oscillator stabilized before the \overline{RESET} goes high.

‡ $P = 1/(\text{input clock frequency})$ in ns. For example, when input clock is 12 MHz, $P = 83.33$ ns.

Figure 5–15. Power-Up Reset (On-Chip Oscillator Active) Timings

5.8.2 Power-Up Reset (On-Chip Oscillator Inactive)

Table 5–12 and Table 5–13 assume testing over recommended operating conditions (see Figure 5–16).

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
I1	$t_w(\overline{\text{INT}}_n)_A$	Pulse width, interrupt high, CPU active	2P		ns
I2	$t_w(\overline{\text{INT}}_n)_A$	Pulse width, interrupt low, CPU active	3P		ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 108 MHz, use P = 9.26 ns.

Figure 5–18. External Interrupt Timings

5.10 Wake-Up From IDLE

Table 5–17 assumes testing over recommended operating conditions (see Figure 5–19).

Table 5–17. Wake-Up From IDLE Switching Characteristics†

NO.	PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
ID1	$t_d(\text{WKPEVTL-CLKGEN})$	Delay time, wake-up event low to clock generation enable (CPU and clock domain idle)		1.25‡		ms
ID2	$t_h(\text{CLKGEN-WKPEVTL})$	Hold time, clock generation enable to wake-up event low (CPU and clock domain in idle)	3P§			ns
ID3	$t_w(\text{WKPEVTL})$	Pulse width, wake-up event low (for CPU idle only)	3P			ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 108 MHz, use P = 9.26 ns.

‡ Estimated data based on 12-MHz crystal used with on-chip oscillator at 25°C. This number will vary based on the actual crystal characteristics operating condition and the PC board layout and the parasitics.

§ Following the clock generation domain idle, the $\overline{\text{INT}}_x$ becomes level-sensitive and stays that way until the low-to-high transition of $\overline{\text{INT}}_x$ following the CPU wake-up. Holding the $\overline{\text{INT}}_x$ low longer than minimum requirement will send more than one interrupt to the CPU. The number of interrupts sent to the CPU depends on the $\overline{\text{INT}}_x$ -low time following the CPU wake-up from IDLE.

Figure 5–19. Wake-Up From IDLE Timings

5.11 XF Timings

Table 5–18 assumes testing over recommended operating conditions (see Figure 5–20).

Table 5–18. XF Switching Characteristics

NO.	PARAMETER		MIN	MAX	UNIT
X1	$t_{d(XF)}$	Delay time, CLKOUT high to XF high	-1	3	ns
		Delay time, CLKOUT high to XF low	-1	3	

† CLKOUT reflects the CPU clock.

Figure 5–20. XF Timings

5.12 General-Purpose Input/Output (GPIO_x) Timings

Table 5–19 and Table 5–20 assume testing over recommended operating conditions (see Figure 5–21).

Table 5–19. GPIO Pins Configured as Inputs Timing Requirements

NO.			MIN	MAX	UNIT
G1	$t_{su}(GPIO-COH)$	Setup time, IO _x input valid before CLKOUT high	GPIO	4	ns
			AGPIO [†]	8	
			EGPIO [‡]	8	
G2	$t_h(COH-GPIO)$	Hold time, IO _x input valid after CLKOUT high	GPIO	0	ns
			AGPIO [†]	0	
			EGPIO [‡]	0	

[†] AGPIO pins: A[15:0]

[‡] EGPIO pins: C13, C10, C7, C5, C4, and C0

Table 5–20. GPIO Pins Configured as Outputs Switching Characteristics

NO.	PARAMETER		MIN	MAX	UNIT

‡ P = 1/CPU clock frequency. For example, when running parts at 108 MHz, use P = 9.26 ns.

§ T = CLKX period = (1 + CLKGDV) * P

C = CLKX low pulse width = T/2 when CLKGDV is odd or zero and = (CLKGDV/2) * P when CLKGDV is even

D = CLKX high pulse width = T/2 when CLKGDV is odd or zero and = (CLKGDV/2 + 1) * P when CLKGDV is even

¶ FSRP = FSXP = 1. As a SPI master, FSX is inverted to provide active-low slave-enable output. As a slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for slave McBSP

FSX should be low before the rising edge of clock to enable slave devices and then begin a SPI transfer at the rising edge of the master clock (CLKX).

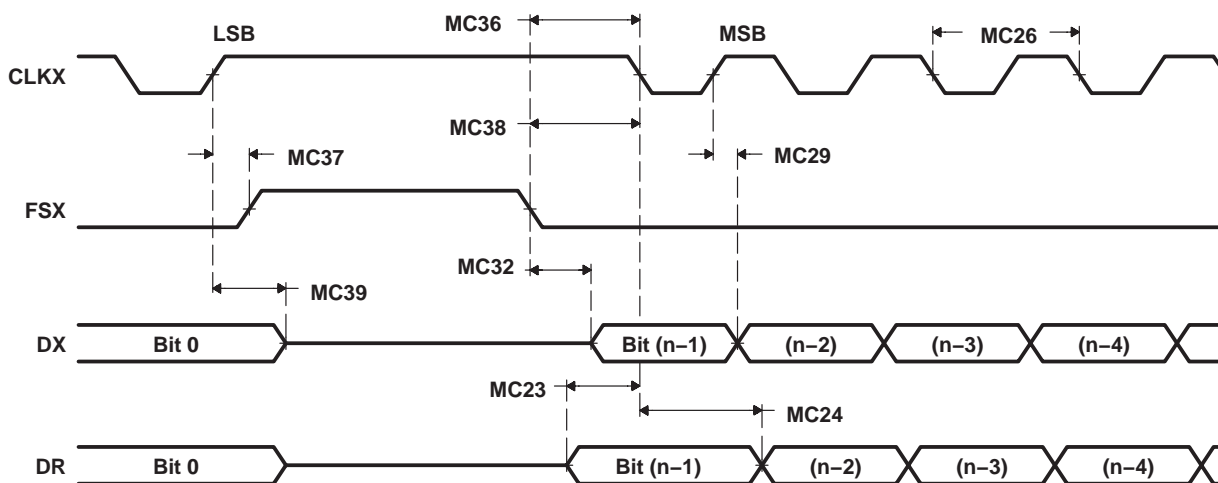

Figure 5–29. McBSP Timings as SPI Master or Slave: CLKSTP = 11b, CLKXP = 1

5.14.4 McBSP General-Purpose I/O Timings

Table 5–35 and Table 5–36 assume testing over recommended operating conditions (see Figure 5–30).

Table 5–35. McBSP General-Purpose I/O Timing Requirements

NO.		MIN	MAX	UNIT
MC20	$t_{su}(MGPIO-COH)$ Setup time, MGPIOx input mode before CLKOUT high [†]	7		ns
MC21	$t_h(COH-MGPIO)$ Hold time, MGPIOx input mode after CLKOUT high [†]	0		ns

[†] MGPIOx refers to CLKRx, FSRx, DRx, CLKXx, or FSXx when configured as a general-purpose input.

Table 5–36. McBSP General-Purpose I/O Switching Characteristics

NO.	PARAMETER	MIN	MAX	UNIT
MC22	$t_d(COH-MGPIO)$ Delay time, CLKOUT high to MGPIOx output mode [‡]	0	7	ns

[‡] MGPIOx refers to CLKRx, FSRx, CLKXx, FSXx, or DXx when configured as a general-purpose output.

[†] CLKOUT reflects the CPU clock.

[‡] MGPIOx refers to CLKRx, FSRx, DRx, CLKXx, or FSXx when configured as a general-purpose input.

[§] MGPIOx refers to CLKRx, FSRx, CLKXx, FSXx, or DXx when configured as a general-purpose output.

Figure 5–30. McBSP General-Purpose I/O Timings

5.15 I²C Timings

Table 5–37 and Table 5–38 assume testing over recommended operating conditions (see Figure 5–31 and Figure 5–32).

Table 5–37. I²C Signals (SDA and SCL) Timing Requirements

NO.			STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
IC1	$t_c(\text{SCL})$	Cycle time, SCL	10		2.5		μs
IC2	$t_{su}(\text{SCLH-SDAL})$	Setup time, SCL high before SDA low for a repeated START condition	4.7		0.6		μs
IC3	$t_h(\text{SCLL-SDAL})$	Hold time, SCL low after SDA low for a START and a repeated START condition	4		0.6		μs
IC4	$t_w(\text{SCLL})$	Pulse duration, SCL low	4.7		1.3		μs
IC5	$t_w(\text{SCLH})$	Pulse duration, SCL high	4		0.6		μs
IC6	$t_{su}(\text{SDA-SCLH})$	Setup time, SDA valid before SCL high	250		100 [†]		ns
IC7	$t_h(\text{SDA-SCLL})$	Hold time, SDA valid after SCL low	0 [‡]		0 [‡]	0.9 [§]	μs
IC8	$t_w(\text{SDAH})$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
IC9	$t_r(\text{SDA})$	Rise time, SDA		1000	$20 + 0.1C_b$ [¶]	300	ns
IC10	$t_r(\text{SCL})$	Rise time, SCL		1000	$20 + 0.1C_b$ [¶]	300	ns
IC11	$t_f(\text{SDA})$	Fall time, SDA		300	$20 + 0.1C_b$ [¶]	300	ns
IC12	$t_f(\text{SCL})$	Fall time, SCL		300	$20 + 0.1C_b$ [¶]	300	ns
IC13	$t_{su}(\text{SCLH-SDAH})$	Setup time, SCL high before SDA high (for STOP condition)	4.0		0.6		μs
IC14	$t_w(\text{SP})$	Pulse duration, spike (must be suppressed)			0	50	ns
IC15	C_b [¶]	Capacitive load for each bus line		400		400	pF

[†] A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement $t_{su}(\text{SDA-SCLH}) \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \text{ max} + t_{su}(\text{SDA-SCLH}) = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.

[‡] A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.

[§] The maximum $t_h(\text{SDA-SCLL})$ has only to be met if the device does not stretch the LOW period [$t_w(\text{SCLL})$] of the SCL signal.

[¶] C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 5-31. I²C Receive Timings

Table 5–38. I²C Signals (SDA and SCL) Switching Characteristics

NO.	PARAMETER	STANDARD MODE		FAST MODE		UNIT
		MIN	MAX	MIN	MAX	
IC16	t _c (SCL) Cycle time, SCL	10		2.5		μs
IC17	t _d (SCLH-SDAL) Delay time, SCL high to SDA low for a repeated START condition	4.7		0.6		μs
IC18	t _d (SDAL-SCLL) Delay time, SDA low to SCL low for a START and a repeated START condition	4		0.6		μs
IC19	t _w (SCLL) Pulse duration, SCL low	4.7		1.3		μs
IC20	t _w (SCLH) Pulse duration, SCL high	4		0.6		μs
IC21	t _d (SDA-SCLH) Delay time, SDA valid to SCL high	250		100		ns
IC22	t _v (SCLL-SDAV) Valid time, SDA valid after SCL low	0		0	0.9	μs
IC23	t _w (SDAH) Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
IC24	t _r (SDA) Rise time, SDA		1000	20 + 0.1C _b [†]	300	ns
IC25	t _r (SCL) Rise time, SCL		1000	20 + 0.1C _b [†]	300	ns
IC26	t _f (SDA) Fall time, SDA		300	20 + 0.1C _b [†]	300	ns
IC27	t _f (SCL) Fall time, SCL		300	20 + 0.1C _b [†]	300	ns
IC28	t _d (SCLH-SDAH) Delay time, SCL high to SDA high for a STOP condition	4		0.6		μs
IC29	C _p Capacitance for each I ² C pin		10		10	pF

[†] C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 5–32. I²C Transmit Timings

5.16 Universal Serial Bus (USB) Timings

Table 5–39 assumes testing over recommended operating conditions (see Figure 5–33 and Figure 5–34).

Table 5–39. Universal Serial Bus (USB) Characteristics

NO.	PARAMETER		FULL SPEED 12Mbps			UNIT
			MIN	TYP	MAX	
U1	t_r	Rise time of DP and DN signals [†]	4		20	ns
U2	t_f	Fall time of DP and DN signals [†]	4		20	ns
	t_{RFM}	Rise/Fall time matching [‡]	90		111.11	%
	V_{CRS}	Output signal cross-over voltage [†]	1.3		2.0	V
	t_{jr}	Differential propagation jitter ^{§¶}	-2		2	ns
	f_{op}	Operating frequency (Full speed mode)		12		Mb/s
U3	$R_s(DP)$	Series resistor		24		Ω
U4	$R_s(DN)$	Series resistor		24		Ω
U5	$C_{edge}(DP)$	Edge rate control capacitor		22		pF
U6	$C_{edge}(DN)$	Edge rate control capacitor		22		pF

[†] $C_L = 50$ pF

[‡] $(t_r/t_f) \times 100$

[§] $t_{px(1)} - t_{px(0)}$

[¶] USB PLL is susceptible to power supply ripple, refer to recommend operating conditions for allowable supply ripple to meet the USB peak-to-peak jitter specification.

Figure 5–33. USB Timings

- NOTES: A. A full-speed buffer is measured with the load shown.
B. $C_L = 50 \text{ pF}$

6.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
TMS320VC5506GHH	ACTIVE	BGA	GHH	179	160	TBD	SNPB	Level-3-220C-168 HR

TMS320VC5506ZHR	ACTIVE	BGA MI CROSTAR	ZHH	179	1000	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
